	US GEAR CORP/HEAT TREAT CORP (Continued)		**1000394164**

Hazardous Waste Summary:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Waste code:	D002
Waste name:	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Waste code:	D003
Waste name:	A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.
Violation Status:	No violations found

Evaluation Action Summary:

Evaluation date:	09/20/1990
Evaluation:	COMPLIANCE EVALUATION INSPECTION ON-SITE
Area of violation:	Not reported

Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Hazardous Waste Summary:

Waste code:	D002
Waste name:	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Facility name: NACME STEEL PROCESSING LLC
Classification: Not a generator, verified

Date form received by agency: 06/12/1998
Facility name: NACME STEEL PROCESSING LLC
Classification: Large Quantity Generator

Hazardous Waste Summary:

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: K062
Waste name: SPENT PICKLE LIQUOR GENERATED BY STEEL FINISHING OPERATIONS OF FACILITIES WITHIN THE IRON AND STEEL INDUSTRY (SIC CODES 331 AND 332).

Biennial Reports:

Hazardous Waste Summary:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Handler Activities Summary:

U.S. importer of hazardous waste:	No
Mixed waste (haz. and radioactive):	No
Recycler of hazardous waste:	No
Transporter of hazardous waste:	No
Treater, storer or disposer of HW:	No
Underground injection activity:	No
On-site burner exemption:	No
Furnace exemption:	No
Used oil fuel burner:	No
Used oil processor:	No
User oil refiner:	No
Used oil fuel marketer to burner:	No
Used oil Specification marketer:	No
Used oil transfer facility:	No
Used oil transporter:	No

Hazardous Waste Summary:

Waste code:	D000
Waste name:	Not Defined

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Site Description: Former secondary smelter of non-ferrous metals such as lead and tin. Smelting these metals created bulk units of babbitt and solder. Not currently known if any metal fabrication was done or if cleaning solvents were used on-site. Preliminary XRF data indicates heavy metal contamination on the soil surface throughout the site as well as on flooring of former sturctures. Residential neighborhoods within 1/4 miles of the property.

Hazardous Waste Summary:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Waste code:	D002
Waste name:	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Site name: AIR PRODUCTS AND CHEMICALS INC
Classification: Not a generator, verified

Date form received by agency: 04/01/1985
Facility name: AIRGAS SPECIALTY GASES
Site name: AIR PRODUCTS AND CHEMICALS INC
Classification: Large Quantity Generator

Hazardous Waste Summary:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Alias EPA ID: Not reported
Site FUDS Flag: Not reported

Alias Comments: Not reported
Site Description: Former secondary smelter of non-ferrous metals such as lead and tin. Smelting these metals created bulk units of babbitt and solder. Not currently known if any metal fabrication was done or if cleaning solvents were used on-site. Preliminary XRF data indicates heavy metal contamination on the soil surface throughout the site as well as on flooring of former sturctures. Residential neighborhoods within 1/4 miles of the property.

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D004
Waste name: ARSENIC

Waste code: D005
Waste name: BARIUM

Annual Waste Handled:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Amount (Lbs): 94163.2

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Amount (Lbs): 440

Historical Generators:

Date form received by agency:	04/28/1995
Facility name:	SMITH TIRE SERVICE
Classification:	Small Quantity Generator

Hazardous Waste Summary:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Hazardous Waste Summary:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

CARVER MILITARY ACADEMY (Continued) **1001116670**

EPA Region: 05
Classification: Small Small Quantity Generator
Description: Handler: generates more than 100 and less than 1000 kg of hazardous waste during any calendar month and accumulates less than 6000 kg of hazardous waste at any time; or generates 100 kg or less of hazardous waste during any calendar month, and accumulates more than 1000 kg of hazardous waste at any time

Owner/Operator Summary:

Owner/operator name:	CHICAGO PUBLIC SCHOOLS
Owner/operator address:	13100 S DOTY AVE CHICAGO, IL 60827
Owner/operator country:	Not reported
Owner/operator telephone:	(773) 535-5250
Legal status:	District
Owner/Operator Type:	Owner
Owner/Op start date:	Not reported
Owner/Op end date:	Not reported

Handler Activities Summary:

U.S. importer of hazardous waste:	No
Mixed waste (haz. and radioactive):	No
Recycler of hazardous waste:	No
Transporter of hazardous waste:	No
Treater, storer or disposer of HW:	No
Underground injection activity:	No
On-site burner exemption:	No
Furnace exemption:	No
Used oil fuel burner:	No
Used oil processor:	No
User oil refiner:	No
Used oil fuel marketer to burner:	No
Used oil Specification marketer:	No
Used oil transfer facility:	No
Used oil transporter:	No

Hazardous Waste Summary:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D003

CARVER MILITARY ACADEMY (Continued) **1001116670**

Waste name:	A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.
Waste code:	D004
Waste name:	ARSENIC
Waste code:	D007
Waste name:	CHROMIUM
Waste code:	D009
Waste name:	MERCURY
Waste code:	F002
Waste name:	THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2-TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE LISTED IN F001, F004, OR F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
Waste code:	F005
Waste name:	THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
Waste code:	P119
Waste name:	AMMONIUM VANADATE
Waste code:	U052
Waste name:	CRESOL (CRESYLIC ACID)
Waste code:	U112
Waste name:	ACETIC ACID ETHYL ESTER (I)
Waste code:	U122
Waste name:	FORMALDEHYDE
Waste code:	U123
Waste name:	FORMIC ACID (C,T)
Waste code:	U154
Waste name:	METHANOL (I)
Waste code:	U196
Waste name:	PYRIDINE
Waste code:	U220

CARVER MILITARY ACADEMY (Continued) **1001116670**

Waste name: BENZENE, METHYL-

Waste code: U228
Waste name: ETHENE, TRICHLORO-

Violation Status: No violations found

Section 4

EPA Waste Code Addendum

SECTION 4 - EPA WASTE CODES

There are no epa codes to report for this search area.

Section 5

Databases Searched and Update Dates

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

FEDERAL RECORDS

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 03/30/2012
Date Data Arrived at EDR: 04/05/2012
Date Made Active in Reports: 05/15/2012
Number of Days to Update: 40

Source: EPA
Telephone: N/A
Last EDR Contact: 07/05/2012
Next Scheduled EDR Contact: 10/22/2012
Data Release Frequency: Quarterly

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 03/30/2012
Date Data Arrived at EDR: 04/05/2012
Date Made Active in Reports: 05/15/2012
Number of Days to Update: 40

Source: EPA
Telephone: N/A
Last EDR Contact: 07/05/2012
Next Scheduled EDR Contact: 10/22/2012
Data Release Frequency: Quarterly

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 12/27/2011
Date Data Arrived at EDR: 02/27/2012
Date Made Active in Reports: 03/12/2012

Last EDR Contact: 07/05/2012
Next Scheduled EDR Contact: 09/10/2012
Data Release Frequency: Quarterly

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA’s knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Date of Government Version: 12/28/2011

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 03/15/2012	Source: Environmental Protection Agency
Date Data Arrived at EDR: 04/04/2012	Telephone: 312-886-6186
Date Made Active in Reports: 05/15/2012	Last EDR Contact: 07/02/2012
Number of Days to Update: 41	Next Scheduled EDR Contact: 10/15/2012
	Data Release Frequency: Quarterly

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 03/15/2012	Source: Environmental Protection Agency
Date Data Arrived at EDR: 04/04/2012	Telephone: 312-886-6186
Date Made Active in Reports: 05/15/2012	Last EDR Contact: 07/02/2012

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

Date of Government Version: 03/15/2012	Source: Environmental Protection Agency
Date Data Arrived at EDR: 04/04/2012	Telephone: 312-886-6186

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

Date of Government Version: 03/15/2012	Source: Environmental Protection Agency
Date Data Arrived at EDR: 04/04/2012	Telephone: 312-886-6186

US ENG CONTROLS: Engineering Controls Sites List

A listing of sites with engineering controls in place. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health.

Date of Government Version: 12/30/2011	Source: Environmental Protection Agency
Date Data Arrived at EDR: 12/30/2011	Telephone: 703-603-0695
Date Made Active in Reports: 01/10/2012	Last EDR Contact: 06/11/2012
Number of Days to Update: 11	Next Scheduled EDR Contact: 09/24/2012
	Data Release Frequency: Varies

US INST CONTROL: Sites with Institutional Controls

A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

Date of Government Version: 12/30/2011	Source: Environmental Protection Agency

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

Date of Government Version: 06/27/2011	Source: Environmental Protection Agency
Date Data Arrived at EDR: 06/27/2011	Telephone: 202-566-2777
Date Made Active in Reports: 09/13/2011	Last EDR Contact: 06/25/2012
Number of Days to Update: 78	Next Scheduled EDR Contact: 10/08/2012
	Data Release Frequency: Semi-Annually

BRS: Biennial Reporting System

The Biennial Reporting System is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures detailed data from two groups: Large Quantity Generators (LQG) and Treatment, Storage, and Disposal Facilities.

Date of Government Version: 12/31/2009	Source: EPA/NTIS
Date Data Arrived at EDR: 03/01/2011	Telephone: 800-424-9346
Date Made Active in Reports: 05/02/2011	Last EDR Contact: 06/01/2012
Number of Days to Update: 62	Next Scheduled EDR Contact: 09/10/2012

Number of Days to Update: 21	Next Scheduled EDR Contact: 11/12/2012
	Data Release Frequency: Semi-Annually

LF WMRC: Waste Management & Research Center Landfill Database

The Waste Management & Research Center Landfill Database includes records from the Department of Public Health, Department of Mines & Minerals, Illinois Environmental Protection Agency, State Geological Survey, Northeastern Illinois Planning Commission and Pollution Control Board.

Date of Government Version: 12/31/2001	Source: Department of Natural Resources
Date Data Arrived at EDR: 10/06/2006	Telephone: 217-333-8940
Date Made Active in Reports: 11/06/2006	Last EDR Contact: 09/18/2009
Number of Days to Update: 31	Next Scheduled EDR Contact: 12/28/2009
	Data Release Frequency: No Update Planned

SWF/LF: Available Disposal for Solid Waste in Illinois - Solid Waste Landfills Subject to State Surcharge

Solid Waste Facilities/Landfill Sites. SWF/LF type records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. Depending on the state, these may be active or inactive facilities or open dumps that failed to meet RCRA Subtitle D Section 4004 criteria for solid waste landfills or disposal sites.

Date of Government Version: 12/31/2010	Source: Illinois Environmental Protection Agency
Date Data Arrived at EDR: 12/21/2011	Telephone: 217-785-8604
Date Made Active in Reports: 12/23/2011	Last EDR Contact: 08/03/2012
Number of Days to Update: 2	Next Scheduled EDR Contact: 11/12/2012
	Data Release Frequency: Annually

IL NIPC: Solid Waste Landfill Inventory

Solid Waste Landfill Inventory. NIPC is an inventory of active and inactive solid waste disposal sites, based on state, local government and historical archive data. Included are numerous sites which previously had never been identified largely because there was no obligation to register such sites prior to 1971.

Date of Government Version: 08/01/1988	Source: Northeastern Illinois Planning Commission
Date Data Arrived at EDR: 08/01/1994	Telephone: 312-454-0400
Date Made Active in Reports: 08/12/1994	Last EDR Contact: 05/23/2006
Number of Days to Update: 11	Next Scheduled EDR Contact: N/A
	Data Release Frequency: No Update Planned

LUST: Leaking Underground Storage Tank Sites

Leaking Underground Storage Tank Incident Reports. LUST records contain an inventory of reported leaking underground storage tank incidents. Not all states maintain these records, and the information stored varies by state.

Date of Government Version: 03/22/2012	Source: Illinois Environmental Protection Agency
Date Data Arrived at EDR: 05/01/2012	Telephone: 217-782-6762

	Data Release Frequency: Varies

EDR PROPRIETARY RECORDS

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Date of Government Version: 05/21/2012	Source: Department of Energy & Environmental Protection
Date Data Arrived at EDR: 05/22/2012	Telephone: 860-424-3375

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association’s annual survey of hospitals.
Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.
Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.
Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics’ primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Private Schools
  Source: National Center for Education Statistics
  Telephone: 202-502-7300
  The National Center for Education Statistics' primary database on private school locations in the United States.
Daycare Centers: Homes & Centers Listing

EDR Site Report™

EDR® Environmental Data Resources Inc

440 Wheelers Farms Road
Milford, CT 06461
Toll Free: 800.352.0050
www.edrnet.com

TABLE OF CONTENTS

The EDR-Site Report™ is a comprehensive presentation of government filings on a facility identified in a search of federal, state and local environmental databases. The report is divided into three sections:

Section 1: Facility Summary . . . . Page 3

Summary of facility filings including a review of the following areas: waste management, waste disposal, multi-media issues, and Superfund liability.

Section 2: Facility Detail Reports . . . . Page 4

All available detailed information from databases where sites are identified.

Section 3: Databases and Update Information. . . . . Page 7

Name, source, update dates, contact phone number and description of each of the databases for this report.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

Appendix C
2014-2015 Red Line Extension Project Update

2014–2015 Red Line Extension Project Update

From 2012-2014, CTA evaluated benefits and impacts of four alternatives: the No Build Alternative, the Bus Rapid Transit Alternative (along Michigan Avenue), the Union Pacific Railroad (UPRR) Rail Alternative, and the Halsted Alternative. CTA evaluated three options of the UPRR Rail Alternative: Right-of-Way Option, East Option, and West Option. CTA also evaluated two options of the UPRR Rail Alternative 130th Street station: a South Station Option and a West Station Option. Based on the project description provided in Section 2 of this technical memorandum, CTA analyzed the impacts of these alternatives and station options. The benefits and impacts are included in the technical memoranda prepared in 2012-2014.

In August 2014, based on the technical analysis and public input, CTA announced the NEPA Preferred Alternative–the UPRR Rail Alternative. Additional conceptual engineering was conducted on the UPRR Rail Alternative to refine the East and West Option alignments. In addition, CTA is considering only the South Station Option of the 130th Street Station.

In late 2014 and early 2015, CTA conducted additional engineering and revised assumptions on the East and West Options to refine the alignments. The refinement of the East and West Options consisted of the following items:

- For the segment of the alignment along I-57, CTA shifted the proposed alignment from the median of I-57 to the north side of I-57 within the existing expressway right-of-way. The construction would be less complex, safer for construction workers, and have a shorter duration. The shift would also allow for fewer impacts to Wendell Smith Park for the East Option, and would allow for no permanent impacts to Wendell Smith Park for the West Option.

- CTA modified the curve speeds as the alignment heads south from I-57 along the UPRR tracks. The curve speed for both the East and West Options would be 35 mph.

- CTA shifted the East Option alignment near 103rd Street station to minimize impacts to Block Park and the Roseland Pumping Station.

- CTA modified the curves south of 103rd Street for both the East and West Options to 55 mph to maximize the train speed.

- CTA refined the layout of the 120th Street yard and shop to optimize yard operations. The refined layout of the yard would accommodate 340 train cars.

The refinement of the East and West Option alignments minimizes potential impacts to parks while providing flexibility for future design phases. The Draft Environmental Impact Statement contains the benefits and impacts of the refined East and West Option alignments and supersedes information presented in other chapters of this technical memorandum.

The refined East and West Option alignments would have no additional or different impacts from those described in the technical memoranda for the following resource areas: construction, transportation, land use and economic development, historic and cultural resources, safety and security, hazardous materials, indirect and cumulative, air quality, floodplains, vegetation and wildlife habitat, threatened and endangered species, and geology and soils.

1.0 Executive Summary

This report presents the results of the Carnow, Conibear & Assoc., Ltd. (Carnow Conibear) Phase I Environmental Site Assessment (ESA) investigation of Blocks 11, 12, and 13 of the Altgeld Gardens public housing project located at the northeast corner of South Greenwood Avenue and East 133rd Street in Chicago, Illinois (subject site). The subject site buildings are currently unoccupied. The Phase I ESA consisted of a visual site inspection, a historical records review, a review of public record documents, and a review of government agency records. The Phase I ESA was conducted in accordance with the American Society for Testing and Materials Standard E 1527-13 (Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process).

A visual inspection was conducted at the subject site on February 17, 2017. The subject site consists of 26 vacant two-story brick buildings, an electrical building, parking lots, sidewalks, and landscape areas. Based upon historical sources, the subject site had been agricultural land in 1938. By 1945, the subject site was developed with 26 residential buildings, sidewalks, and landscape areas. The electrical building was added to the subject site by 2007. The property has remained relatively unchanged until the time of this assessment.

The subject site was listed in the environmental databases consulted for this ESA. Federal, state, and local agencies accessed during the assessment revealed records of environmental concern in connection with the subject site. This assessment has revealed no evidence of Recognized Environmental Conditions (RECs) in connection with the subject site, except for the following:

- The presence of five incinerators on the subject site. The incinerators were used to burn garbage from the 1940's until their use was terminated in the 1970's. The burning of garbage in the incinerators over that period could contribute contamination from ash, spills, or leaching to the immediate vicinity, and therefore the incinerators are considered a Recognized Environmental Condition to the subject site.

The following were found to be *de minimis* conditions, defined as conditions that are not RECs and generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies:

- In 1996 and 2000, soil samples were collected from the subject site and analyzed for pesticides. One soil sample from Block 12 contained concentrations of pesticides that exceeded the SROs promulgated in 35 IAC 742, also known as *Tiered Approach to Corrective Action Objectives* (TACO). The Illinois Department of Public Health reviewed the sampling data and prepared the February 16, 2001 Health Consultation letter. The IDPH concluded that no apparent public health hazard exists from exposure to the pesticide residuals detected in surface soil. Therefore, the concentrations of pesticides detected in the 1996 and 2000 sampling events in Blocks 11, 12, and 13 can be considered a de minimis condition to the subject site, as defined in Section 3.2.22 of ASTM E1527-13. If soil is excavated from the areas where concentrations exceeded SROs, the soil should be handled and/or disposed of properly. In 2009, additional soil samples were collected from the subject site. Twenty-four of 122 soil samples contained

PNAs and/or arsenic that exceeded the SROs promulgated in 35 IAC 742. Carnow Conibear performed a 95% Upper Confidence Limit (UCL) evaluation of the data pursuant to 35 IAC 742.225(d) and (e). The objective of this evaluation was to determine whether the resulting 95% UCL concentration of each analyte, as derived from the data/results (sample population), is less than the corresponding applicable Tier 1 residential ingestion SRO. The results of this analysis indicate that each 95% UCL concentration is below the corresponding applicable Tier 1 residential ingestion SRO (or median background concentration) for each respective analyte. Therefore, the concentrations of PNAs and arsenic detected in the July 2009 GSG sampling event can be considered a de minimis condition to the subject site, because the concentrations do not generally present a threat to human health or the environment and generally would not be the subject of an enforcement action if brought to the attention of the appropriate governmental agencies, as defined in Section 3.2.22 of ASTM E1527-13. If soil is excavated from the areas where concentrations exceeded SROs, the soil should be handled and/or disposed of properly. USEPA recommended that CHA reduce residents' contact with PAH contaminated soils, including establishing groundcover, placing wood chips, and planting grass.

With respect to the ASTM standard, there were limitations associated with this Phase I ESA. Limitations included:

- Due to flooding, the basement and crawl space areas of the subject site were inaccessible at the time of site inspection.

The Executive Summary is intended to provide a brief summary of the findings of the recent site investigation. The entire report must be read in order to fully understand the findings and potential environmental concerns associated with the subject site; therefore, the Executive Summary should not be substituted in lieu of reading the entire report.

2.0 Introduction

2.1 Purpose

The Chicago Housing Authority (CHA) retained Carnow, Conibear & Assoc., Ltd. (Carnow Conibear) to perform a Phase I Environmental Site Assessment (ESA) of the property associated with Blocks 11, 12, and 13 of the Altgeld Gardens housing project located at the northeast corner of South Greenwood Avenue and 133rd Street in Chicago, Illinois (subject site). The purpose of the Phase I ESA was to obtain and evaluate information related to any Recognized Environmental Conditions (RECs) that might be present on the subject site.

2.2 Detailed Scope of Service

The Phase I ESA was performed for the subject site in accordance with the current American Society of Testing Materials (ASTM) Standard E 1527-13 (Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process). The following activities were conducted:

- A visual investigation of the subject site;
- Visual inspection of at least 10% of the building units;
- Interview with the site representative;
- Interview with the Phase I ESA User;
- Review of topographic, soils, and floodplain data;
- Review of United States Geological Survey (USGS) maps;
- Review of historic Sanborn Fire Insurance Maps;
- Review of historic city directory listings;
- Review of accessible government/public records;
- Review of local, state and federal databases; and
- A limited inspection of the adjacent properties from vantage points accessible to the public.

2.3 Significant Assumptions

With respect to the ASTM standard, there were no significant assumptions associated with this Phase I ESA.

2.4 Limitations & Exceptions

With respect to the ASTM standard, there were limitations associated with this Phase I ESA. Carnow Conibear was unable to inspect the basement areas of the buildings due to flooding.

2.5 Special Terms & Conditions

With respect to the ASTM standard, there were no special terms or conditions involved in this Phase I ESA.

2.6 User Reliance

No environmental site assessment can wholly eliminate uncertainty regarding the potential for RECs in connection with a property. This Phase I ESA, in accordance to ASTM Standard E 1527-13, is intended to reduce, but not eliminate, uncertainty regarding the potential for RECs for the subject site, given reasonable limits in time and cost. Based solely upon the work performed in connection with this Phase I ESA Report, which has taken into account commonly known and reasonably ascertainable information, and subject to all conditions and exceptions set forth in this report, the following entity can rely on this report when assessing environmental conditions pertaining to the subject site:

Chicago Housing Authority
60 East Van Buren, 13th Floor
Chicago, IL 60605

No other party may rely on this Phase I ESA without the prior express written consent of Carnow Conibear.

3.0 Site Description

3.1 Site Location

The subject site is located on the northeast corner of South Greenwood Avenue and E. 133rd Street in Chicago, Illinois. The subject site is bounded by E. 130th Place, beyond which is TCA Health Clinic and its associated parking lot to the north, E. 130th Place, an urban garden, E. 133rd Street to the east, E. 133rd Street to the south, and S. Greenwood Avenue to the west. According to the United States Geological Survey (USGS) Topographic Map Lake Calumet, Illinois dated 1997, the subject site is located in Section 35, Township 37 North, Range 14 East of the Third Principal Meridian in Cook County, Illinois. The Property Index Number (PIN) associated with the subject site is 25-35-100-019-0000. **Appendix A** presents the location of the subject site. The following table lists addresses associated with the subject site buildings:

Address	Block	Number of Units	Building Type
1101-1111 E. 130th Pl	11	6	A-11-12
1113-1135 E. 130th Pl	11	12	CL-11-2
1137-1147 E. 130th Pl	11	6	A-11-1
1149-1171 E. 130th Pl	11	12	CR-11-1
13031-13053 S. Greenwood Ave	11	12	CR-11-2
13055-13077 S. Greenwood Ave	11	12	CL-11-3
1100-1106 E. 131st St	11	4	D-11
1108-1130 E. 131st St	11	12	CR-11-3
1132-1142 E. 131st St	11	6	B-11
1144-1166 E. 131st St	11	12	CL-11-1
13201-13223 S. Greenwood Ave	12	12	CR-12-2
13241-13263 S. Greenwood Ave	12	12	CL-12-1
1101-1107 E. 132nd St	12	4	D-12-1
1109-1131 E. 132nd St	12	12	CL-12-3
1133-1143 E. 132nd St	12	6	B-12
1145-1167 E. 132nd St	12	12	CR-12-3
1100-1106 E. 133rd St	12	4	D-12-2
1108-1130 E. 133rd St	12	12	CR-12-1
1132-1142 E. 133rd St	12	6	A-12
1144-1166 E. 133rd St	12	12	CL-12-2
13101-13107 S. Greenwood Ave	13	4	D-13-1
1101-1123 E. 131st St	13	12	CR-13-1
1125-1147 E. 131st St	13	12	CL-13-2
1100-1122 E. 132nd St	13	12	CL-13-1
1124-1134 E. 132nd St	13	6	B-13
1136-1158 E. 132nd St	13	12	CR-13-2

3.2 Site & Vicinity General Characteristics

The subject site is located in a residential zone in Chicago, Illinois. It is a portion of the Altgeld Gardens housing development owned and operated by the CHA. The subject site consists of three blocks of the development. The remainder of the Altgeld Gardens development includes an additional fourteen blocks of residences, a maintenance building, a Chicago Park District field house and park, school buildings, and day care centers. Two more blocks of former CHA residential housing developments are located south of E. 133rd St. and were known as the Phillip Murray Homes.

The topography of the subject site and adjacent properties is relatively level, with no significant natural relief features. **Appendix B** depicts a detailed site plan and adjacent properties.

3.3 Current Use & Ownership

The subject site totals approximately 17.3 acres in area and currently consists of 26 vacant two-story multi-unit residential buildings, an electrical building, parking lots, sidewalks, and landscape areas. The property is owned by the CHA. Photographs of the subject site and adjacent properties are provided in **Appendix C**.

3.4 Site Infrastructure

The subject site consists of 26 two-story brick buildings with a crawl space under the ground floor of the majority of the buildings. Three buildings, one in each block, had a basement. An electrical building containing transformers and switchgears was present on Block 11.

The following companies supply or formerly supplied utilities to the subject site:

Utilities	
Natural Gas	Constellation Energy
Electricity	Integrys Energy
Storm & Sanitary Sewers	City of Chicago
Potable Water	City of Chicago

3.5 Current Uses of Adjacent Properties

Adjacent properties with contiguous property lines were visually inspected from vantage points available to the general public. The subject site is bordered by the following properties:

Adjacent Properties	
North	East 130th Place, beyond which is TCA Health Clinic and its associated parking lot.
East	East 130th Place, CHA land currently used for urban gardening, and East 133rd Street beyond which is CHA land and Beaubien Forest Preserve.
South	East 133rd Street, beyond which is undeveloped land and the Little Calumet River.
West	South Greenwood Avenue, beyond which are Blocks 9 and 10 of the CHA Altgeld Garden Housing Complex. On some maps, South Greenwood Avenue is depicted as Leanna Tucker Avenue.

4.0 User Provided Information

ASTM Standard E 1527-13 requires the user of a Phase I ESA to provide the environmental professional with any information that could be deemed useful in identifying RECs. The User of this Phase I ESA is the CHA. A User Questionnaire was completed by Ms. Lynn Crivello, Environmental Engineer of the CHA, and was returned to Carnow Conibear on March 2, 2017. The User Questionnaire and associated correspondence can be reviewed in **Appendix D**.

4.1 Title Records

A real title search including any deeds, easements, leases, restrictions, and covenants for a period of fifty years was not provided to Carnow Conibear. However, a title search is not required by ASTM if other historical sources of information provide the necessary information. Carnow Conibear believes that the data collected during the Phase I ESA provided sufficient information about the site which eliminates the need for a fifty year title search. The site buildings were constructed between 1942 and 1944. CHA has been the owner of the property since 1956.

4.2 Environmental Liens or Activity & Use Limitations

This investigation, including information obtained from the User Questionnaires completed by the CHA, has revealed no record of environmental liens or activity use limitations specific to the subject site.

4.3 Specialized Information

Ms. Crivello indicated that the residential units are vacant and there are currently no occupants or business present in the site.

4.4 Commonly Known or Reasonably Ascertainable Information

Ms. Crivello indicated that she has no commonly known or reasonably ascertainable information concerning the subject site.

4.5 Valuation Reduction for Environmental Issues

Ms. Crivello indicated that there are currently no real estate actions related to this site.

4.6 Owner, Property Manager, and/or Occupant Information

The CHA has indicated that the subject site is owned by the CHA and is currently vacant. The subject site property is managed by East Lake Management Group, Inc.

4.7 Reasons for Performing this Phase I ESA

The reason for performing the Phase I ESA as a NEPA review for demolition.

4.8 Previous Environmental Reports

CHA provided Carnow Conibear with electronic versions of approximately 44 reports, letters, and miscellaneous documents (including duplicates) concerning the Altgeld Gardens and Murray Homes housing developments. Many of the documents dealt with areas outside of the boundary of this Phase I. Brief summaries of the reports (including some text copied verbatim from the documents) that directly related to the subject site (Blocks 11, 12, and 13) are provided below. Selected pages have been extracted from the reports and included in **Appendix E-1**.

File Name:	1996 August Aerial Photo Analysis		
Document Title:	AERIAL PHOTOGRAPHIC ANALYSIS ALTGELD GARDENS	**Date:**	August 1996
Document Type:	Report	**Pages:**	21
Prepared By:	Lockheed Environmental Systems & Technologies Co.	**Prepared For:**	US EPA
Notes: This report presents findings of an analysis of historical aerial photography spanning the period 1938 to 1976. The analysis was performed for the study area known as the Pullman Sewage Farm and the community of Altgeld Gardens in Chicago, Illinois. This analysis was requested by Region 5 to document the possible disposal of sewage sludge and landfilling operations that may have taken place before housing was built. Findings from the analysis indicate that the results of filling activity were observed in 1959 and 1967 in the Pullman site, which is west of Altgeld Gardens across S. Lawrence Ave. The material used for filling could not be identified; it appeared to be light-toned, but it could not be determined what the nature of the material was or if any wastes were incorporated into this material. No evidence of the effluent ditch, referred to in the collateral information, was identified in the period of analysis. **Pages Extracted: Selected text and Aerial Photos**			

File Name:	1996 November Aerial Photo Analysis		
Document Title:	AERIAL PHOTOGRAPHIC ANALYSIS ALTGELD GARDENS	**Date:**	November 1996
Document Type:	Report	**Pages:**	16
Prepared By:	Lockheed Environmental Systems & Technologies Co.	**Prepared For:**	US EPA
Notes: This report is an addendum to TS-PIC 9605510. It presents the results of an aerial photographic analysis of the Altgeld Gardens extended study area located in Chicago, Illinois. The primary data used for this report are two selected dates of black-and-white photographs: November 14, 1938 and September 3, 1959. This analysis was requested to document the possible disposal of sewage sludge and landfilling operations that may have taken place before housing was built in			

the Altgeld Gardens extended study area. Findings from the analysis indicate evidence of a possible drainageway in the Altgeld Gardens Housing Development Area in 1938. This possible drainage way cuts through Blocks 3, 4, 7, 9, 10, and 12.

File Name:	1997-8-6_USEPA Site Assessment		
Document Title:	SITE ASSESSMENT REPORT FOR THE ALTGELD GARDENS COMMUNITY	**Date:**	August 6, 1997
Document Type:	Report	**Pages:**	71
Prepared By:	US EPA	**Prepared For:**	---

Notes:
US EPA assessed the possible presence of soil contamination at the Altgeld Gardens Community (AGC). CHA was advised of proposed assessment work and participated in sampling. Nine standing water samples were collected from flooded areas. Fourteen surface soil samples and ten subsurface soil samples were collected.

The water samples, surface soil samples, and sub-surface samples were analyzed for acid base neutrals (ABN), pesticides/polychlorinated biphenyls (PCBs), volatile organic analytes (VOAs), metals, mercury, and cyanide. All samples were analyzed at the U.S. EPA Central Regional Laboratory (CRL), Chicago, Illinois. Analytical results indicate that slightly elevated levels of PAH compounds may be present in the surface soils within the AGC area.

Analyses of surface soils, sub-surface soils and standing water within the AGC indicate that although elevated levels of PAHs were identified in surface soils within Block 11, the levels do not exceed the recommended removal action level (RAL) for total PAHs established in the "Emergency Removal Guidelines." Information from this report is being reviewed by U.S. EPA for a health based risk assessment. There are no conditions present in the areas assessed at the AGC that may present an imminent and substantial threat to public health and welfare and the environment. There were no conditions observed at the AGC during the site assessment which warrant a removal action.

File Name:	USEPA 5-98 Fact Sheet		
Document Title:	US EPA FACT SHEET, Altgeld Murray Gardens	**Date:**	May 1998
Document Type:	Fact Sheet	**Pages:**	4
Prepared By:	US EPA	**Prepared For:**	---

Notes:
This fact sheet describes the usage and sampling history of the site. It states that PAH and pesticide contamination was identified in 1996 and 1997 sampling events, and states the following:

Using USEPA risk assessment methodology, the lifetime excess cancer risk for exposure to the highest concentration of PAHs ranged from 2 x 10 (2 out of 10,000 exposed individuals) to 3 x 10 (3 out of 1,000 exposed individuals). In interpreting these estimates, one should keep in mind these are risks that are likely to be very similar to those experienced in any other urban site. In addition, the sampling results, as well as aerial photos of the area, reveal no physical evidence that Altgeld Gardens was built on a landfill or evidence of industrial contamination in the surface soil.

At this time US EPA has determined that additional sampling in the Altgeld Gardens is not necessary because Altgeld Garden levels were similar to those identified in studies of other urban areas. However, US EPA is conducting a PAH and lead background study to verify PAH and lead background levels for the City of Chicago. Information gathered in this study will be used to help determine future cleanup action levels for urban sites in general.

File Name:	1998-8-27_USEPA_Ltr on PAHs Present at Altgeld		
Document Title:	Re: Altgeld Gardens Housing Complex	**Date:**	August 27, 1998
Document Type:	Letter	**Pages:**	2
Prepared By:	US EPA	**Prepared For:**	CHA

Notes:
USEPA collected samples in 1996 at the request of the community and found PAH contamination. USEPA found no evidence of a specific source and suspects that atmospheric deposition from point, area, and mobile sources were likely responsible. A comparison of PAH levels detected at Altgeld Gardens to those found in other urban areas indicated that the Altgeld values were within the expected range. USEPA strongly recommends that CHA reduce residents' contact with PAH contaminated soils, including establishing groundcover, placing wood chips, and planting grass. These activities will greatly reduce risk to children and adults by eliminating direct contact with contaminated soils. These measures may also result in the reduction of the PAH compounds through a natural process known as phyto-remediation.

Document Title:	Re: Altgeld Gardens Community	**Date:**	September 11, 2000
Document Type:	Letter	**Pages:**	3
Prepared By:	US EPA	**Prepared For:**	Hopkins & Sutter

Notes:
Information concerning the potential analytical problems involving the United States Environmental Protection Agency's (U.S. EPA) Central Regional Laboratory, and U.S. EPA's proposal to conduct core sampling for Polychlorinated Biphenyls (PCBs) in the yards on the north side of the Dorothy Gautreax Child Parent Center, 975 E. 132nd Street, Chicago, Illinois (Gautreax Center), and surface soil and surface water sampling in the area throughout the

community housing, as in the enclosed figure.

During the spring of 1996 the Chicago Housing Authority (CHA) conducted a cleanup of soil contaminated with PCBs, a chemical regulated under the Toxic Substances Control Act, from the yards on the north side of the Gautreax Center. The source of the PCB contamination was a storage lot located across the street from the Gautreax Center where the CHA had disposed PCBs from electrical transformers. During the cleanup, approximately one foot of soil was excavated across the entire north side of the Gautreax Center, cleanup confirmation samples were collected, and the area was backfilled with clean soil trucked in from off site. U.S. EPA, Region 5, conducted oversight of the CHA's cleanup and assisted the CHA by providing laboratory analysis of the CHA's samples. Based on the sample analysis, Region 5 determined that the PCB cleanup level of less than 10 parts per million (ppm) had been met, and the area could be backfilled to grade with clean soil.

During 1996 and 1997, U.S. EPA also conducted surface soil and water sampling in certain areas of the housing complex in response to residents' concerns with potential contamination. The surface soil samples and surface water samples were analyzed for a full range of contaminants. Low levels of polycyclic aromatic hydrocarbons (PAHs), mainly Benzo(a)pyrene and low levels of DDD, DDT and DDE, were found in the soil samples. Although results were below action levels, U.S. EPA recommended to the CHA that a grass cover be placed in areas where bare soil was present. This grass cover prevents direct contact with soil.

Since these actions, allegations of misconduct in the analysis of samples have been made. Because of these allegations, U.S. EPA has determined that data generated from samples analyzed by these individuals will not be relied on for its decisions. Even though U.S. EPA has reviewed the 1996 raw analytical data and cannot conclude that there was any failure to follow analytical procedures which caused the analytical results to be lower than target levels indicating a need for cleanup, U.S. EPA believes the most prudent course of action is to resample this area, U.S. EPA must emphasize that the north yards are covered by approximately one foot of clean soil and do not present a significant risk to children attending the Gautreax Center or to the nearby community. It should also be noted that no similar problems have been found with the cleanup at the Altgeld Gardens storage lot, which was completed last summer.

With regard to the Superfund sampling, all locations will need to be resampled by U.S. EPA. However, samples will only be analyzed for pesticides and volatile organic compounds. U.S. EPA intends to conduct this sampling by the middle of September.

File Name:	2000-11-15_E-E Rpt		
Document Title:	Letter Report for Altgeld Gardens	**Date:**	November 15, 2000
Document Type:	Report	**Pages:**	47
Prepared By:	Ecology & Environment, Inc.	**Prepared For:**	US EPA

Notes:
The purpose of the site assessment was to resample surface soil locations on the Altgeld

Gardens Community (AGC) that were originally sampled by U.S. EPA in 1996 and 1997 and analyzed for poly aromatic hydrocarbons (PAHs) and pesticides. Analytical results from that sampling effort are suspect because recent investigations have determined that certain analytical data, including pesticide analyses, generated by CRL at the time of the U.S. EPA Altgeld Gardens soil sampling event may be erroneous.

Various pesticides were detected in every soil sample. In general it appears, from a comparison of the data, that the U.S. EPA sample results were higher than those of the START samples, although not in all cases.

This report is discussed in greater detail later in this section of the Phase I ESA report.

File Name:	2001-2-16_Dept of Health and Human Serv_Altgeld Health Consultation		
Document Title:	Health Consultation, October 2000 Soil Sampling, Altgeld Gardens	**Date:**	February 16, 2001
Document Type:	Report	**Pages:**	12
Prepared By:	US Dept. of Health and Human Services/Illinois Department of Public Health	**Prepared For:**	US EPA

Notes:
US EPA requested IDPH to evaluate public health hazards from soil at Atlgeld Gardens.
From the summary: US EPA conducted site investigation at Altgeld Gardens in 1996. In 1998, IDPH evaluated the data and concluded that no apparent public health hazard existed from exposure to the surface soil contamination detected. IDPH recommended additional surface soil samples near the sample with the greatest pesticide levels. In 1999, US EPA collected 12 soil samples along 134th street on the southern edge of Altgeld Gardens. IDPH concluded that no apparent public health hazard existed from exposure to the pesticide residuals detected in the surface soils.

In 2000, 10 surface soil samples were collected from the top 2 to 3 inches of soil and analyzed for pesticides. DDT, DDE, and heptachlor epoxide were detected, but IDPH concludes that no apparent public health hazard exists from exposure to the pesticide residuals detected in surface soil.

This report is discussed in greater detail later in this section of the Phase I ESA report

Document Title:	Summary Report, Altgeld Gardens Renovation, Blocks 11, 12, and 13	**Date:**	July 1, 2009
Document Type:	Report	**Pages:**	209
Prepared By:	GSG Consultants, Inc.	**Prepared For:**	CHA

Notes: Report summarizes the findings of field sampling activities within landscaped areas of Blocks 11, 12, and 13. GSG performed 122 soil borings to maximum depth of 2 feet. Samples analyzed for Polynuclear Aromatics Hydrocarbons (PAH), and total lead and arsenic. A total of 24 of the 122 sample locations reported values that exceed PNAs and arsenic Tier 1 Soil Remediation Objectives (SROs) for residential properties or Metropolitan Area background concentrations. None of the collected soil samples exhibit lead values above Tier 1 SROs for residential properties. **This report is discussed in greater detail later in this section of the Phase I ESA report** **Pages Extracted: Figures showing exceedances.**

The following potential contamination issues were identified in the review of the documents provided by CHA:

November 15, 2000, Letter Report for Altgeld Gardens, and February 16, 2001, Health Consultation

The November 15, 2000, Letter Report prepared by Ecology and Environment, Inc. (E&E) for the US EPA presents the results of pesticide sampling and resampling conducted throughout the Altgeld Gardens and Murray Homes developments. In 1996, three of the samples were collected from the subject site: S15 (Block 11), S16 (Block 12), and S20 (Block 13). In 2000, these areas were resampled and given the following sample names: AGS10 (Block 11), AGS8 (Block 12), and AGS9 (Block 13). All of the soil samples were grab samples collected from two to three inches below the grass surface.

Pesticides were detected in each of the samples. Carnow Conibear evaluated the soil analysis data in relation to the SROs promulgated in 35 IAC 742, also known as *Tiered Approach to Corrective Action Objectives* (TACO). The soil samples from Block 12 (S16/AGS8) contained concentrations of two pesticides that were slightly above the SRO for Residential Ingestion. The DDE concentration detected was 2.399 mg/kg, which is slightly above the SRO of 2.0 mg/kg, and the Heptachlor epoxide concentration detected was 0.0974 mg/kg, which is slightly above the SRO of 0.07 mg/kg.

There is no obvious, discrete source for the pesticide concentrations detected in the samples. Based on the dispersed nature of the identified compounds, there is no clear point source or "hot spot" of contamination.

The Illinois Department of Public Health reviewed the sampling data and prepared the February 16, 2001 Health Consultation letter. The IDPH concluded that no apparent public health hazard exists from exposure to the pesticide residuals detected in surface soil.

Therefore, the concentrations of pesticides detected in the 1996 and 2000 sampling events in Blocks 11, 12, and 13 can be considered a de minimis condition to the subject site as defined in Section 3.2.22 of ASTM E1527-13. If soil is excavated from the areas where concentrations exceeded SROs, the soil should be handled and/or disposed of properly.

July 1, 2009, Summary Report

The July 1, 2009, *Summary Report, Altgeld Gardens Renovation, Blocks 11, 12, and 13*, prepared by GSG Consultants, Inc. (GSG) for the CHA, was labeled "DRAFT Work In Progress". The report documents soil sampling performed by GSG within Blocks 11, 12, and 13. One hundred and twenty-two (122) soil borings were installed throughout the blocks. Soil samples were collected for analysis from depth intervals of approximately 6 inches to 1 foot and from 1 foot to 2 feet below existing landscaped surfaces. Soil samples were analyzed for Polynuclear Aromatic Hydrocarbons (PNAs), total lead and total arsenic. GSG reported that 24 of the 122 sample locations reported values that exceeded the Tier 1 Soil Remediation Objectives (SROs) promulgated in 35 IAC 742 TACO for PNAs and/or arsenic. No SRO exceedances for lead were reported. GSG recommended that soil exceeding Tier 1 SROs should not be used as backfill during site renovation activities and that it be disposed of at a licensed Subtitle D landfill if it is removed from the site. GSG estimated the volume of soil exceeding Tier 1 SROs to be 2,497 cubic yards.

Carnow Conibear evaluated the soil analysis data in relation to the SROs promulgated in 35 IAC 742 TACO. Arsenic and five PNAs were identified in exceedance of the applicable Tier 1 SROs for the residential ingestion exposure route. Based on the dispersed nature of the identified exceedances, there is no clear point source or "hot spot" of contamination.

Carnow Conibear performed a 95% Upper Confidence Limit (UCL) evaluation of the data pursuant to 35 IAC 742.225(d) and (e). The objective of this evaluation was to determine whether the resulting 95% UCL concentration of each analyte, as derived from the data/results (sample population), is less than the corresponding applicable Tier 1 residential ingestion SRO, as adjusted for background concentrations in the City of Chicago for PNAs and counties within Metropolitan Statistical Areas (MSAs) for arsenic. Carnow Conibear utilized the Statistical Software *ProUCL 4.1 for Environmental Applications* to calculate the 95% UCL for the five PNA compounds and arsenic. These data sets incorporated appropriate methods to address "No-Detects." The resulting concentrations are presented in the following table:

Analyte	**95% UCL (mg/kg) All Data**	**Applicable Tier 1 SRO (mg/kg)**	**Exceedance?**
Arsenic	10.51	13.0	No
Benzo(a)anthracene	0.961	1.1*	No
Benzo(a)pyrene	0.544	1.3*	No
Benzo(b)fluoranthene	0.698	0.9	No
Dibenzo(a,h)anthracene	0.114	0.2*	No
Indeno(1,2,3-c,d)pyrene	0.199	0.9	No

* Indicates median background concentration applied as Tier 1 SRO.

The results of this analysis indicate that each 95% UCL concentration is below the corresponding applicable Tier 1 residential ingestion SRO (or median background concentration) for each respective analyte. Therefore, the concentrations of PNAs and arsenic detected in the July 2009 GSG sampling event can be considered a de minimis condition to the subject site, because the concentrations do not generally present a threat to human health or the environment and generally would not be the subject of an enforcement action if brought to the attention of the appropriate governmental agencies, as defined in Section 3.2.22 of ASTM E1527-13. If soil is excavated from the areas where concentrations exceeded SROs, the soil should be handled and/or disposed of properly.

The 95% Upper Confidence Level ProUCL analysis is presented in **Appendix E-2**.

5.0 Records Review

5.1 Standard Environmental Record Sources

This section presents the results of the state and federal government agency Freedom of Information Act (FOIA) responses and the government agency database search that was performed by Environmental Data Resources, Inc. (EDR) in accordance with the ASTM standard.

5.1.1 Federal & State Regulatory Agencies

Carnow Conibear submitted FOIA requests and reviewed public online databases of state and federal agencies in an effort to obtain information regarding the subject site and adjacent properties. Documentation of the FOIA correspondence and database search results can be found in **Appendix F-1**. The following agencies were contacted:

- United States Environmental Protection Agency (USEPA)

  Carnow Conibear searched the USEPA's EnviroFacts online database. Altgeld Gardens, which includes the subject site, was listed on the database under Agency Compliance and Enforcement Systems (ACES) as an operator of apartment buildings. The subject site was not flagged for Significant Non-compliance (SNC) or High Priority Violations (HPV).

- Illinois Environmental Protection Agency (IEPA)
  Springfield, Illinois

  Carnow Conibear submitted a FOIA request to the IEPA on September 29, 2016 regarding any information of environmental concern for the subject site. A response was received from the IEPA on October 5, 2016 indicating that they had no records on file for the subject site addresses.

  Carnow Conibear searched online IEPA databases for Leaking Underground Storage Tanks (LUST) incidents, Site Remediation Program (SRP) properties, and publicly available environmental documents on March 2, 2017. The subject site was not identified in the IEPA databases.

- Illinois Emergency Management Agency (IEMA)
  Springfield, Illinois

  Carnow Conibear's search of the IEMA's online Hazardous Materials Incident Reports database did not reveal any record of incidents on the subject site. IEMA has record of the abandonment of an 85 gallon drum of unknown material in the road right of way near 1100 E. 130th Place on July 30, 2003. The drum was removed from the road. The listing did not indicate a release to the ground.

- Illinois Office of the State Fire Marshal (OSFM)
  Springfield, Illinois

Carnow Conibear searched the OSFM's State of Illinois UST online database for addresses on E. 130th Place, Greenwood Avenue, E. 131st Street, E. 132nd Street, and E. 133rd Street in Chicago, Illinois. The subject site and immediately adjacent properties were not listed in the OSFM database.

5.1.2 Regulatory Database Inquiry

Carnow Conibear retained EDR to conduct a search of available environmental databases for the subject site and surrounding properties. The databases were searched according to ASTM standards, with supplemental environmental information also provided. The descriptions, sources, telephone numbers, and government version dates for each of the databases are provided in **Appendix F-2**. Carnow Conibear used the subject site to specify the site location as the "target property." The following table lists the databases searched by EDR and the corresponding ASTM search distances.

Database	ASTM Search Distance	Number of Properties Found
National Priority List (NPL) The federal National Priority List is a federal list of abandoned or uncontrolled hazardous waste sites identified for priority remedial action under the Superfund program.	1.0 Mile	0
Delisted National Priority List (D-NPL) The National Oil and Hazardous Substances Pollution Control Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.	0.5 Mile	0
Comprehensive Environmental Response & Liability Information System (CERCLIS) The federally maintained Comprehensive Environmental Response, Compensation and Liability Information System is a compilation of past and current sites that the EPA has investigated pursuant to the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA). It also includes abandoned or uncontrolled waste sites identified under the federal Superfund Program.	0.5 Mile	0
CERCLIS No Further Remedial Action Planned (NFRAP) Sites which have been investigated and subsequently delisted from the federal CERCLIS are designated as No Further Remedial Action Planned (NFRAP) sites.	0.5 Mile	1
Resource Conservation Recovery Act (RCRA) Information RCRA Information is EPA's comprehensive information system, including information on selective information on sites which treat, store or dispose (TSD) hazardous wastes. CORRACTS identifies hazardous waste handlers with RCRA corrective action activity. Conditionally exempt small quantity generators (CESQGs) generate less than 100 kilograms (kg) of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs) generate over 1,000 kg of hazardous waste, or over 1 kg of acutely hazardous waste per	Subject Site or Adjacent Property * 0.5 Mile if TSD	0

Database	ASTM Search Distance	Number of Properties Found
month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDs treat, store or dispose of waste.		
Federal/State Engineering/Institutional Controls Registries These federal and state registries list sites with engineering or institutional controls associated with them. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are often required as a part of institutional controls.	Subject Site	0
Emergency Response Notification System (ERNS) Emergency Response Notification System, maintained by the federal government, records and stores information on reported releases of oil and hazardous substances.	Subject Site	0
State Hazardous Waste Sites (SHWS) State hazardous waste sites records are the state's equivalent to the federal CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for clean-up using state funds are identifiable along with sites where cleanup will be paid by potentially responsible parties.	0.5 Mile	0
Solid Waste Facilities / Landfill Sites (SWF/LF) Solid Waste Facilities / Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. These may be active or inactive facilities, or open dumps that failed to meet RCRA subtitle D Section 4004 criteria for solid waste landfills or disposal sites.	0.5 Mile	0
Underground Storage Tank (UST) A database of registered USTs that are regulated under Subtitle I of RCRA and must be registered with the state department responsible for administering the UST program. In Illinois the UST registry is maintained by the Office of the State Fire Marshall.	Subject Site or Adjacent Property	0
Leaking Underground Storage Tank (LUST) The Leaking Underground Storage Tank records contain an inventory of LUST incidents reported to the state.	0.5 Mile	1
Site Remediation Program (SRP) The Illinois Site Remediation Program (SRP) database includes properties that are enrolled in the state's voluntary clean-up program.	0.5 Mile	1
Brownfields Brownfields are abandoned or underused industrial and/or commercial properties that are contaminated (or thought to be contaminated) and have an active potential for redevelopment. The Illinois Municipal Brownfields Redevelopment Grant Program offers	0.5 Mile	0

Database	ASTM Search Distance	Number of Properties Found
grants to assist in site investigation activities, development cleanup objectives, and performance of cleanup activities.		

Note: The report also includes additional databases that are not required to be searched by ASTM standards. These additional database results are reviewed for potential environmental impact on the subject site.

The subject site addresses were not identified in the databases accessed by EDR.

Due to the densely-urbanized area in which the subject site is located, EDR identified numerous listings in the surrounding area. Carnow Conibear evaluated these listings to determine if any may potentially represent a REC, Historical REC, Controlled REC, business risk, or *deminimis* condition for the subject site. Considerations for potential vapor intrusion concerns were also made including Areas of Concern (AOCs), Critical Distances, and applicable adjustments discussed in ASTM Standard E2600-10 (Standard Guide for Vapor Encroachment Screening on Property involved in Real Estate Transactions), though a complete Vapor Encroachment Screening was not conducted within the scope of this assessment. The following table summarizes sites that could possibly affect the environmental conditions at the subject site. The complete EDR report is presented in **Appendix F-2**.

Distance from Site	Owner/Address	Listed Database	Comments
North Adjacent <1/8mile 85 ft. Higher Relative Elevation 600 ft.	Chicago, City of 1100 East 130th Place Chicago, IL 60827	RCRA-SQG	EPA ID: ILR000122952 Small quantity generator, no violations found. Hazardous Waste Summary: D001-Ignitable
West < 1/8 mile 633 ft. Higher Relative Elevation 587 ft.	Altgeld Gardens 977 East 132nd Street Chicago, IL 60827	RCRA-CESQG FINDS ECHO	EPA ID: ILR000101980 Conditionally exempt small quantity generator, no violations found. Registry ID: 110006409779 Envid: 1004697962

NOTE: Carnow Conibear has interpreted the EDR Report to eliminate duplicate addresses and misspellings reported to the governmental agencies.

Review of the EDR environmental database listings is summarized below:

- City of Chicago, located at 1100 E. 130th Place, is listed as a RCRA small quantity generator with no violations. Based on the lack of reported violation, this listing should not pose a significant threat to the subject site at this time.

- Altgeld Gardens, located at 977 E. 132nd Street, is listed as a RCRA conditionally exempt small quantity generator with no violations. Based on the lack of reported violation, this listing should not pose a significant threat to the subject site at this time.

- Noonies Cleaners Inc, located at 13124 S. Ellis Avenue, is listed as a historical cleaners approximately 649 feet west of the subject site. No additional environmental records or citations were found for this site. Based on the lack of reported violation, this site should not pose a significant threat to the subject site at this time.

- Chicago Housing Authority (maintenance building), located at 940 E. 132nd Street, is listed as having one LUST/SPILLS incident (20070682) and one 1,000 gallon gasoline UST. Online review of the OSFM website indicates that the UST was removed on May 21, 2007. A NFA/NFR Letter was issued for LUST incident 20070682 on September 10, 2007.

  The maintenance building property was enrolled into the Site Remediation Program (SRP) on November 23, 2011 and issued LPC# 31654003. An NFA/NFR letter has not been issued for the site. Reports provided by CHA indicate that a Comprehensive Site Investigation/ Remediation Objectives Report/Remedial Action Plan (CSI/ROR/RAP), dated November 18, 2011, was submitted to the IEPA for approval. Contaminants identified at the site include PNAs, mercury, lead, arsenic, and manganese. After additional soil sampling requested by the IEPA in a CSI/ROR/RAP Comments letter dated January 19, 2012 was submitted, the IEPA approved the Response to CSI/ROR/RAP Comments letter. The January 19, 2012, sampling report demonstrated that the contaminants at the site were not a threat to Class I Groundwater.

  Based on the current SRP status, the nature of the contaminants, and the distance from the subject site (over 700 feet) this site does not represent a REC to the subject site.

  The Chicago Housing Authority site is listed as a RCRA Non-Generator with no violations.

  The site was listed in the FIFRA/TSCA Tracking System (FTTS) for inspections of PCBs. Reports provided by CHA indicate that PCB contamination has been remediated to acceptable levels on the property and is no longer a concern.

- Carver Park Natatorium, located at 939 E. 132nd Street, is listed as a RCRA conditionally exempt small quantity generator with no violations. The site is listed as having one 5,000-gallon heating oil UST. The UST is listed as having been abandoned in place. These listings do not represent RECs to the subject site.

- Calumet NU Earth, located at 130th Street and Doty Avenue, is listed as an IL NIPC site. Review of the NIPC Historical Inventory of Solid Waste Disposal Sites in Northeast Illinois indicates that the site is located in Section 26, Township 37N, Range 14E. Online review of the IEPA Bureau of Land databases indicates that the site has IEPA number 0316490016. Based on the lack of reported violation, this listing should not pose a significant threat to the subject site at this time.

- Land & Lakes Transfer Station is listed as a RCRA small quantity generator with no violations. Online review of the USEPA Envirofacts database found that the site is located on across the Little Calumet River on 138th Street and not adjacent to the subject site. Based on the distance to the subject site, this listing should not pose a significant threat to the subject site at this time.

5.1.3 EDR Orphan Sites

There were six orphan sites (listed sites that could not be mapped due to poor or inadequate address information) identified during the database search. Upon further investigation, no evidence was found to suggest that these sites would pose an environmental threat to the subject site. The complete orphan site list is included in **Appendix F-2**.

5.2 Additional Environmental Record Sources

5.2.1 Local Government Agencies

Carnow Conibear submitted FOIA requests to local agencies in an effort to obtain information regarding the subject site. Copies of the state and local requests and responses can be found in **Appendix F-1**. The following agencies were contacted:

- City of Chicago Fire Department (CFD), Chicago, IL

  Carnow Conibear received a response from the CFD on October 4, 2016 indicating that they have no records concerning for the subject site.

- Chicago Department of Public Health (CDPH), Chicago, IL

  Online review of CDPH Environmental Records Lookup Table found records concerning the subject site consisting of asbestos abatement work, permits for surface cleaning/grinding and the installation of combustion emission unit, and a complaint and inspection concerning a diesel fuel spill from a leaking generator. CDPH records indicate that the spill was remediated and no notice of violation was issued.

- Chicago Department of Fleet and Facilities Management (2FM), Chicago, IL

  Carnow Conibear did not receive a response from 2FM.

- Cook County Recorder of Deeds (CCRD), Cook County, IL

  Carnow Conibear searched the Cook County Recorder of Deeds website for Chain of Title documents on file for the subject site PIN. No environmental liens or deed restrictions of environmental significance were encountered.

5.3 Physical Setting Sources

5.3.1 Surface Water Characteristics

The topography of the subject site and adjacent properties is relatively level, with no significant natural relief features. According to the USGS 7.5-minute topographic quadrangle for Lake Calumet, Illinois (dated 1997) accessed by EDR, the elevation in the vicinity of the subject site is approximately 589 feet above mean sea level.

The Federal Emergency Management Agency (FEMA) lists the subject site in an area determined to be outside the 0.2% annual chance floodplain. [National Flood Insurance

Program, Map numbers 17031C0661J, 17031C0662J, 17031C0663J, and 17031C0664J, August 19, 2008]

According to the map provided by EDR, there are no wetlands on the subject site. No standing bodies of water or wetland vegetation was observed during the recent site inspection.

5.3.2 Subsurface Geological Characteristics

Surficial geology at the site is mapped in the Wadsworth Formation of the Wedron Group. This unit is a succession of calcareous gray, fine-textured till consisting mainly of clay, silt, and fine sand. Although most of the till beds in this formation appear relatively homogeneous and massive, some contain silt laminae and sand lenses. Dominant pebble rock types are dolomite and shale (Hansel & Johnson, 1996, and Stiff, 2000).

Carnow Conibear reviewed Plate 1 of the ISGS Circular, *Potential for Contamination of Shallow Aquifers in Illinoi*s, indicating that the regional geologic materials underlying the subject site are designated as “B1” and “E”. The “B1” classification denotes the presence of sand and gravel at the surface in layers less than 20 feet thick, which are underlain by till or impermeable bedrock. Although the sand and gravel may be used for local well points, these deposits generally do not yield large quantities of water. The potential for contamination of surface water and groundwater in B1 areas is high. A hydraulic conductivity of about 1×10^{-3} cm/sec (high) makes these materials an excellent medium for transport of contaminants. Because water may flow along contacts between materials with different textures (e.g. through sand and gravel over dense bedrock) and discharge on slopes, there is also a potential for ground-to-surface water contamination in B1 areas. The “E” classification denotes deposits of uniform, relatively impermeable silty or clayey till or other fine-grained materials that are more than 50 feet thick, with no identified sand and gravel layers. The potential for contamination in E areas is low because of low hydraulic conductivity in the till, 1×10^{-9} to 1×10^{-7} cm/sec, and good attenuation capacities of the materials. (Berg, et al. 1984)

Per Plate 2 of the Berg Circular, the subject site is located in area designated as “C1” and “D2”. C1 areas are described as sand and gravel at the surface, less than 20 feet thick; underlain by till or impermeable bedrock. D2 areas are described as uniform, relatively impermeable silty or clayey till or other fine-grained materials extending from the surface to more than 20 feet deep; no interbedded sand and gravel.

5.3.3 Groundwater Characteristics

The EDR database identified several historic wells in the general vicinity of the subject site. No wells were identified on the subject site, and information regarding other wells in the area did not provide enough information regarding the direction of groundwater flow. Information from the well searches performed by EDR can be viewed in **Appendix F-2**.

Carnow Conibear searched the IEPA Bureau of Land (BOL) online database for groundwater ordinances in the City of Chicago. An ordinance was enacted in May of 1997 restricting the installation and use of potable water wells within the City limits. This ordinance is accepted by the IEPA as an environmental institutional control pursuant to Title 35 Illinois Administrative Code Part 742 (35 IAC 742).

Two (2) primary aquifers are present in the Chicago metropolitan region. These aquifers are the shallow dolomite aquifer (which includes the bedrock strata directly underlying the unconsolidated glacial sediments) and the deep Cambrian-Ordovician Aquifer (which predominately consists of sandstone) and is isolated from the shallow dolomite aquifer by up to 250 feet of shale. Discontinuous glacial aquifers are also present in the Chicago region in the form of lacustrine sands (Dolton Member of the Equality Formation) and outwash sand and gravel of the Henry and Wedron Formations (Willman, 1971).

5.4 Historical Use Information

5.4.1 Historical Aerial Photographs

Historical aerial photographs for the subject site and surrounding areas were reviewed for the years 1938, 1952, 1962, 1964, 1974, 1988, 1993, 1998, 2005, 2007, 2009, 2010, 2011, and 2012. Carnow Conibear reviewed the photographs in an effort to determine former site usage and identify potential environmental concerns. The Aerial Photo Decade Package provided by EDR can be viewed in **Appendix G-1**.

Review of the historical aerial indicated that the subject site was agricultural land in 1938. By 1952, residential Blocks 1 through 13 and other assorted buildings pertaining to Altgeld Gardens had been developed. Vacant land is depicted to the north, beyond which is E. 130th Street; vacant land and Beaubien Forest Preserve to the east, beyond which are railroad tracks; vacant land to the south, beyond which is the Little Calumet River; and residential Blocks 9 and 10 of Altgeld Gardens to the west. The 1962 photograph depicts the development of residential Block 15 of Altgeld Gardens immediately southwest of the subject site. Two roads have been added north of the subject site and the church building has been developed west of Block 11. There are no significant changes until 1975 when a road is depicted east of Blocks 11 and 13 of the subject site and E. 132nd Street has been extended further east. The 1998 photograph depicts the development of the clinic building and associated parking lot on the north adjacent property. By 2007, the electrical building had been developed on the east central portion of Block 11 of the subject site. There were no other significant changes to the subsequent aerial photographs.

5.4.2 Sanborn Fire Insurance Maps

Carnow Conibear retained EDR to provide Sanborn Fire insurance Maps for the subject site and surrounding area. The EDR Sanborn Library includes more than 1.2 million Sanborn maps from the Library of Congress, University Publications of America, and a private collection. Sanborn Map coverage was available for review for the years 1975, 1987, 1989, 1992, 2002, and 2004. The Sanborn Report supplied by EDR can be viewed in **Appendix G-2**.

Sanborn Map Date	Subject Site Usage	Adjacent Property Usage
1975	The subject site consists of 26 two-story residential building and parking lots.	• North adjacent property – E. 130th Place, beyond which is vacant land. • East adjacent properties – Vacant land and Beaubien Forest Preserve, beyond which are railroad tracks. • South adjacent property – E. 133rd Street , beyond which is a playground.

Sanborn Map Date	Subject Site Usage	Adjacent Property Usage
		• West adjacent properties – S. Greenwood Avenue, beyond which are several residential buildings associated with Altgeld Gardens Apartments and the United Church.
1987	The 1987 Sanborn map reveals no significant changes to the subject site as compared to the 1975 map.	• North adjacent property – No significant changes. • East adjacent properties – No significant changes. • South adjacent property – No significant changes. • West adjacent properties – No significant changes.
1989	The 1989 Sanborn map reveals no significant changes to the subject site as compared to the 1987 map.	• North adjacent property – No significant changes. • East adjacent properties – No significant changes. • South adjacent properties – No significant changes. • West adjacent properties – No significant changes.
1992	The subject site is not depicted on the 1992 map.	• North adjacent property – No significant changes. • East adjacent properties – No significant changes. • South adjacent properties – No significant changes. • West adjacent properties – No significant changes.
2002	The 2002 Sanborn map reveals no significant changes to the subject site as compared to the 1989 map.	• North adjacent property – A public building has been developed beyond E. 130th Place. • East adjacent properties – No significant changes. • South adjacent properties – No significant changes. • West adjacent properties – No significant changes.
2004	The 2004 Sanborn map reveals no significant changes to the subject site as compared to the 2002 map.	• North adjacent property – No significant changes. • East adjacent properties – No significant changes. • South adjacent property – No significant changes • West adjacent properties – No significant changes.

Review of the Sanborn maps indicates that the subject site has been utilized for residential purposes since at least 1975.

6.0 Site Reconnaissance

6.1 Methodology & Limiting Conditions

A visual inspection of the subject site was conducted on February 17, 2017 by Ms. Nohemi Melero of Carnow Conibear. Mr. Gregory Burton, Ms. Alexis Morsby, and Ms. Teri Payton, A Janitor and C Janitors respectively at East Lake Management Group, Inc., provided access to the subject site buildings during the inspection. Conditions during the visit were favorable with dry sunny weather. Photographs taken at the subject site can be viewed in **Appendix C**.

6.2 General Site Setting

The subject site is located in a residential area of Chicago, Illinois. **Appendix B** depicts the Site Plan and adjacent properties.

6.3 Exterior Observations

The subject site consists of 26 two-story brick buildings, an electrical building, parking lots, sidewalks, and landscape areas. Each residential building had a mechanical room at one end with boilers, a water tank, and a water heater.

Five of the residential buildings on the subject site had former incinerators attached to the end of the building. According to Mr. Joseph Rogers, Maintenance Supervisor with Eastlake Management Group, the incinerators were used to burn garbage from the 1940's until their use was terminated in the 1970's, when garbage burning was banned. The burning of garbage in the incinerators over that period could contribute contamination from ash, spills, or leaching to the immediate vicinity, and therefore the incinerators are considered a REC to the subject site.

Exterior Site Observations	
Lot Size	~ 17.3 acres
Shape of Parcel(s)	Irregular
Buildings on Site	Twenty six residential buildings, one electrical building.
Exterior Improvements	No
Pools of Liquid	Yes, basements and crawl spaces were flooded. Standing water from what appears to be a broken pipeline was observed in the landscape area in the southern portion of Block 11.
Drums, Hazardous Material or Petroleum/Unidentified Substance Containers	No
Stained Soil or Pavement	Block 11 – Stained transformer concrete pad
Stressed Vegetation	No
Wells	No
Solid Waste or Fill Material	No
Pits, Ponds, Lagoons, Surface Water, Waste Water	No
Septic Systems	No

Exterior Site Observations	
Railroad Tracks	No
Pipeline(s)	No
Incinerators	5 Incinerators: Block 11 – 1113-1135 E. 130th Pl. Block 11 – 1108-1130 E. 130th St. Block 12 – 1109-1131 E. 132nd St. Block 13 – 1101-1123 E. 131st St. Block 13 – 1136-1158 E. 132nd St.

6.4 Interior Observations

The subject site buildings consist of a twenty six two-story multi-residential brick buildings which are currently vacant. Carnow Conibear inspected one residential unit from each of the subject site multi-unit buildings, with the exception of building 1108-1130 E. 133rd St., which had a missing wall between two regular units. The ground floors consist of living rooms and kitchen areas. The second floors consist of bedrooms, restrooms, and closets. Peeling paint was observed in the majority of the units inspected. There are crawl spaces under the ground level flooring in all of the residential buildings, except the three buildings which have basements. Heating was provided by steam radiators heated by natural gas boilers located in the building with basements. The electrical building housed transformers and switchgears.

Site Observations	
Number of Floors in Buildings	Residential Building – 2 floors Electrical building – 1 floor
Units Inspected	**Block 11:** 13053 S. Greenwood Avenue 13055 S. Greenwood Avenue 1103 E. 130th Place 1135 E. 130th Place 1137 E. 130th Place 1161 E. 130th Place 1100 E. 131st Street 1130 E. 131st Street 1132 E. 131st Street 1146 E. 131st Street **Block 12:** 13223 S. Greenwood Avenue 13241 S. Greenwood Avenue 1101 E. 132nd Street 1109 E. 132nd Street 1141 E. 132nd Street 1165 E. 132nd Street 1106 E. 133rd Street 1108-1110 E. 133rd Street 1132 E. 133rd Street 1144 E. 133rd Street **Block 13:** 13107 S. Greenwood Avenue 1123 E. 131st Street 1125 E. 131st Street 1122 E. 132nd Street 1124 E. 132nd Street

Site Observations	
	1136 E. 132nd Street
Basement	3 Basements: Block 11 – 1132-1142 E. 131st St. Block 12 – 1133-1143 E. 132nd St. Block 13 – 1124-1134 E. 132nd St.
Pools of Liquid	None
Drums, Hazardous Material or Petroleum/Unidentified Substance Containers	None
Building Heating Type	Natural gas, Boiler/Radiators
Building Cooling Type	None
Pits, Waste Water	None
Sumps	Yes, 2 sumps in each building with a basement.

6.5 Hazardous Substances and/or Chemical Storage

On May 19, 1980, the U.S. Environmental Protection Agency (EPA) published, in the Federal Register, the first phase of the Resource Conservation and Recovery Act (RCRA), 1980 RCRA Laws. RCRA defines a hazardous waste as a solid waste that may cause or significantly contribute to serious illness or death, or that poses a substantial threat to human health or the environment when improperly managed.

The storage of hazardous substances or chemicals was not observed on the subject site at the time of the site inspection.

6.6 Above Ground & Underground Storage Tanks & Pipelines

6.6.1 On-Site

No evidence of the presence of UST, ASTs, or pipelines was observed on the subject site.

6.6.2 Adjacent Properties

No evidence of the presence of UST, ASTs, or pipelines was observed on the immediately adjacent portions of the bordering properties from publicly accessible vantage points.

6.7 Suspected Polychlorinated Biphenyls (PCB)-Containing Equipment

The Toxic Substance Control Act (TSCA) of 1976 mandates the regulation of toxic substances known as polychlorinated biphenyls (PCBs), a chemical component of many dielectric fluids, heat transfer fluids, hydraulic fluids, and lubricating oils. Equipment that may potentially contain PCBs includes electrical equipment such as transformers or capacitors, or hydraulically operated equipment, such as elevators, compaction equipment, or manufacturing equipment. Regulations promulgated under TSCA require that transformers containing PCBs be marked as such. A PCB Ban Rule was enacted in 1979 to eliminate the use of PCBs altogether. The owner of the transformer or other PCB-containing equipment is responsible for equipment maintenance and remediation in the event of a leak or release.

Three pad-mounted transformers were observed on the subject site during the site visit. The transformer components had been removed. According to Mr. Joseph Rogers with Eastlake Management, the CHA had replaced PCB-containing transformers in Altgeld Gardens between 2001 and 2003. Mr. Rogers indicated that ComEd removed the internal components from each of the transformers.

7.0 Interviews

7.1 Interview with Site Owner/Manager

Mr. Joseph Rogers, Maintenance Supervisor with Eastlake Management Group, was interviewed on March 3, 2017 during a telephone interview. Mr. Rogers indicated that he did not know of any USTs, ASTs, environmental liens associated with the subject site. Mr. Rogers indicated that improvements were made to the subject site units as the units became vacated by residents. There is no hydraulic equipment on the subject site. There are no thermostats in the residential units. Heat was regulated from the basement. According to Mr. Rogers, there is one transformer in each Block. The PCB-containing transformers were removed between 2001 and 2003.

Mr. Rogers stated that the incinerators located on the subject site were used to burn garbage and that their use was terminated in the 1970's when garbage burning was banned. The burning of garbage in the incinerators over that period could contribute contamination from ash, spills, or leaching to the immediate vicinity, and therefore the incinerators are considered a REC to the subject site.

7.2 Interviews with Occupants

The subject site buildings are currently vacant.

7.3 Interview with Phase I ESA User

A User Questionnaire was completed by Ms. Lynn Crivello, Environmental Engineer of the CHA. Information obtained from the User Questionnaire is summarized in **Section 4.0**. The User Questionnaire can be reviewed in **Appendix D**.

8.0 Findings & Opinions

Based on the findings of this Phase I Environmental Site Assessment, within the scope of this investigation and pursuant to the requirements of ASTM Standard Practice E 1527-13, the following findings are presented below:

8.1 General Findings

- The subject site is located in a residential area of Chicago, Illinois.
- According to historical sources accessed during this assessment, the subject site was agricultural land in 1938. By 1945, the subject site was developed with 26 residential buildings, sidewalks, and landscape areas. The electrical building was added to Block 11 of the subject site by 2007. The subject site has remained relatively unchanged to this time.
- Five of the buildings within the subject site have attached incinerators. The incinerators were used to burn garbage from the 1940's until the 1970's, when garbage burning was banned.
- In 1996 and 2000, soil samples were collected from the subject site and analyzed for pesticides. One soil sample from Block 12 contained concentrations of pesticides that exceeded the SROs promulgated in 35 IAC 742 TACO. The Illinois Department of Public Health reviewed the sampling data and prepared the February 16, 2001 Health Consultation letter. The IDPH concluded that no apparent public health hazard exists from exposure to the pesticide residuals detected in surface soil.
- In 2009, additional soil samples were collected from the subject site. Twenty-four of 122 soil samples contained PNAs and/or arsenic that exceeded the SROs promulgated in 35 IAC 742 TACO.
- During the visual inspection of the subject site, the basement and crawl space areas were inaccessible due to flooding. Carnow Conibear was unable to inspect the mechanical equipment located in the basement areas.

8.2 Recognized Environmental Conditions

The ASTM standard defines a REC as the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. This assessment has revealed no evidence of RECs in connection with the subject site, except for the following:

- Five incinerators were observed on the subject site. The incinerators were used to burn garbage from the 1940's until their use was terminated in the 1970's. The burning of garbage in the incinerators over that period could contribute contamination from ash, spills, or leaching to the immediate vicinity, and therefore the incinerators are considered a REC to the subject site.

8.3 Controlled Recognized Environmental Conditions

The ASTM standard defines a Controlled REC as a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls. This investigation did not find any Controlled RECs in connection with the subject site.

8.4 Historical Recognized Environmental Conditions

The ASTM standard defines a Historical REC as a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls. This investigation found no Historical RECs in connection with the subject site.

8.5 De Minimis Conditions

The following were found to be *de minimis* conditions, defined as conditions that are not RECs and generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies, as defined in Section 3.2.22 of ASTM E1527-13:

- In 1996 and 2000, soil samples were collected from the subject site and analyzed for pesticides. One soil sample from Block 12 contained concentrations of pesticides that exceeded the SROs promulgated in 35 IAC 742 TACO. The IDPH concluded that no apparent public health hazard exists from exposure to the pesticide residuals detected in surface soil. Therefore, the concentrations of pesticides detected in the 1996 and 2000 sampling events in Blocks 11, 12, and 13 can be considered a de minimis condition to the subject site. If soil is excavated from the areas where concentrations exceeded SROs, the soil should be handled and/or disposed of properly.

- In 2009, additional soil samples were collected from the subject site. Twenty-four of 122 soil samples contained PNAs and/or arsenic that exceeded the SROs promulgated in 35 IAC 742. Carnow Conibear performed a 95% Upper Confidence Limit (UCL) evaluation of the data pursuant to 35 IAC 742.225(d) and (e). The results of this analysis indicate that each 95% UCL concentration is below the corresponding applicable Tier 1 residential ingestion SRO (or median background concentration) for each respective analyte. Therefore, the concentrations of PNAs and arsenic detected in the July 2009 GSG sampling event can be considered a de minimis condition to the subject site. If soil is excavated from the areas where concentrations exceeded SROs, the soil should be handled and/or disposed of properly.

8.6 Business Risks

A business environmental risk refers to a risk which can have a material environmental or environmentally-driven impact on the business associated with the current or planned use of a parcel of commercial real estate, not necessarily limited to those environmental issues required to be investigated as a part of ASTM 1527. This investigation found no business risks in connection with the subject site.

8.7 Data Gaps

When conducting a Phase I ESA investigation, an environmental professionals' ability to identify RECs is sometimes limited due to data gaps. Data gaps are not inherently significant, but can be substantive to a report if other information and/or professional experience raise reasonable concerns regarding the data gap.

One common type of data gap is data failure – the inability to find sources to adequately identify the historical uses of the subject site. ASTM 1527-13 requires that historical uses of a property be identified in five year intervals back to 1940 or the property's first development, whichever is earlier, as long as the information is reasonably ascertainable. If specific use of the property appears unchanged over a period of longer than five years, then research of the use of the property during intervening years is not required.

This investigation has identified sources of information from 1938, 1952, 1962, 1964, 1974, 1975, 1987, 1988, 1992, 1993, 1998, 2002, 2004, 2005, 2007, 2009, 2010, and 2011. Historical information suggests that the subject site had been agricultural land in 1938. By 1945, the subject site was developed with 26 residential buildings, sidewalks, and landscape areas. The electrical building was added to the subject site by 2007. The subject site has remained relatively unaltered since this time.

Carnow Conibear believes based on professional experience, adequate historical information on the subject site was obtained, and the data failure does not represent a significant data gap to the study.

9.0 Conclusions

Carnow Conibear has performed a Phase I Environmental Site Assessment, in conformance with the scope and limitations of the current ASTM Practice E 1527, of the property associated with Blocks 11, 12, and 13 of the Altgeld Gardens housing project located at the northeast corner of South Greenwood Avenue and 133rd Street in Chicago, Illinois (subject site). Any exceptions to, or deletions from, the practice are described in **Section 2.4** of this report. This assessment has revealed no evidence of RECs in connection with the subject site, except for the following:

- Five incinerators were observed on the subject site. The incinerators were used to burn garbage from the 1940's until their use was terminated in the 1970's. The burning of garbage in the incinerators over that period could contribute contamination from ash, spills, or leaching to the immediate vicinity, and therefore the incinerators are considered a REC to the subject site.

Carnow Conibear has applied prevailing industry standards and reasonable judgment and effort within the scope of work outlined in Carnow Conibear's proposal, while conducting the Phase I ESA. The standards, judgment, and effort used by Carnow Conibear personnel to investigate, assess, and determine the presence of potential environmental hazards and liabilities associated with the site are consistent with the requirements outlined in the current ASTM Standards No. E1527. Carnow Conibear makes no warranty, express or implied, that the findings and interpretations in this report are a complete representation of the environmental hazards and liabilities, associated with the site. There may be unrecorded information or documentation from previous owners or tenants that is unattainable and may be proprietary, legally protected, or unavailable through government regulatory services.

10.0 Deviations

Carnow Conibear has performed a Phase I Environmental Site Assessment, in conformance with the scope and limitations of the current ASTM Practice E 1527, of the property associated with Blocks 11, 12, and 13 of the Altgeld Gardens housing project located at the northeast corner of South Greenwood Avenue and 133rd Street in Chicago, Illinois (the subject site). Any exceptions to, or deletions from, the practice are described in **Section 2.4** of this report. No other significant deviations are noted with this report.

12.0 Signature & Qualifications of the Environmental Professional

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in §312.10 of 40 CFR 312,

and,

I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject site. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Phase I Environmental Site Assessment Client Questionnaire

ASTM Standard E1527-13 requires the user of the Environmental Site Assessment (ESA) to complete the following questionnaire. The questions should be answered to the best of your actual knowledge. Please explain all answers thoroughly, utilizing extra paper as needed. Failure to provide the following information will be listed as a data gap within the report.

Property Name: Altgeld Gardens - Blocks 11, 12, & 13

Property Address: Northeast Corner of Greenwood Avenue & E. 133rd Street, Chicago, IL 60627

(1) What is the reason for conducting this Phase I ESA? (ASTM 1527-13, 6.8)
If no answer is provided, CCA will assume the purpose of the Phase I ESA is to qualify for an LLP to CERCLA liability and will state this in the report.

NEPA Review for Demolition

(2) Do you know of any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on, or from the property? (ASTM 1527-13, 10.9)
☐**Yes** ☑**No**
If yes, please explain below:

(3) Do you know of any pending, threatened, or past administrative proceedings relevant to hazardous substances or petroleum products in, on, or from the property? (ASTM 1527-13, 10.9)
☐**Yes** ☑**No**
If yes, please explain below:

(4) Do you know of any notices from any government entity regarding any possible violation of environmental laws or possible liability relating to hazardous substances or petroleum products? (ASTM 1527-13, 10.9)
☐**Yes** ☑**No**
If yes, please explain below:

(5) Environmental cleanup liens that are filed or recorded against the site (40 CFR 312.25).
Are you aware of any environmental cleanup liens against the *property* that are filed or recorded under federal, tribal, state or local law?
☐**Yes** ☑**No**
If yes, please explain below:

(6) Activity and land use limitations (AULs) that are in place on the site or that have been filed or recorded in a registry (40 CFR 312.26).
Are you aware of any AULs[1], such as *engineering controls*, land use restrictions or *institutional controls* that are in place at the site and/or have been filed or recorded in a registry under federal, tribal, state or local law?

☐**Yes** ☑**No**

If yes, please explain below:

(7) Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28).
As the *user* of this *ESA* do you have any specialized knowledge or experience related to the *property* or nearby properties? For example, are you involved in the same line of business as the current or former *occupants* of the *property* or an adjoining *property* so that you would have specialized knowledge of the chemicals and processes used by this type of business?

☐**Yes** ☐**No**

If yes, please explain below:

NA The residential units are vacant. There are currently no occupants or businesses present on the site.

(8) Relationship of the purchase price to the fair market value of the *property* if it were not contaminated (40 CFR 312.29).
Does the purchase price being paid for this property reasonably reflect the fair market value of the property?

☐**Yes** ☐**No**

If no, please explain below:

NA There are currently no real estate actions related to this site

If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property?

☐**Yes** ☐**No**

If yes, please explain below:

NA See Above

(9) Commonly known or *reasonably ascertainable* information about the *property* (40 CFR 312.30).
Are you aware of commonly known or *reasonably ascertainable* information about the *property* that would help the *environmental professional* to identify conditions indicative of releases or threatened releases? For example, as *user*,

(a.)Do you know the past uses of the *property*?

☐**Yes** ☑**No**

If yes, please explain below:

(b.)Do you know of specific chemicals that are present or once were present at the *property*?

☐**Yes** ☑**No**

If yes, please explain below:

(c.)Do you know of spills or other chemical releases that have taken place at the *property*?

☐**Yes** ☑**No**

If yes, please explain below:

(d.)Do you know of any environmental cleanups that have taken place at the *property*?

☐**Yes** ☑**No**

If yes, please explain below:

(e.)Do you know of any environmental assessments that have taken place at the *property*? If so, please attach copies of the assessment or cleanup reports.

☐**Yes** ☑**No**

(10) The degree of obviousness of the presence of likely presence of contamination at the *property*, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).

As the *user* of this *ESA*, based on your knowledge and experience related to the *property* are there any *obvious* indicators that point to the presence or likely presence of contamination at the *property*?

☐**Yes** ☑**No**

If yes, please explain below:

I have completed the preceding questions in good faith and to the extent of my actual knowledge.

[1] *As defined in 3.2.2 of ASTM Standard E 1527-13, an AUL stands for activity and use limitations – legal or physical restrictions or limitations on the use of, or access to, a site or facility: (1) to reduce or eliminate potential exposure to hazardous substances or petroleum products in the soil, soil vapor, groundwater, and/or surface water on the property, or (2)to prevent activities that could interfere with the effectiveness of a response action in order to ensure maintenance of a condition of no significant risk to public health or the environment. These legal or physical restrictions, which may include institutional and/or engineering controls, are intended to prevent adverse impacts to individuals or populations that may be exposed to hazardous substances and petroleum products in the soil, ground water, and/or surface water on the property.*

ABSTRACT

This report presents findings of an analysis of historical aerial photography spanning the period 1938 to 1976. The analysis was performed for the study area known as the Pullman Sewage Farm and the community of Altgeld Gardens in Chicago, Illinois. It consists of approximately 400 acres bordered on the north by 130th Street, on the east by the Calumet Expressway, on the south by the Little Calumet River, and on the west by Indiana Avenue. The collateral information supplied by Region 5 reports that the Pullman Sewage Farm facility had been used as a site for the deposition of liquid wastes from 1881 to 1907. This analysis was requested by Region 5 to document the possible disposal of sewage sludge and landfilling operations that may have taken place before housing was built.

Findings from the analysis indicate that the results of filling activity were observed in 1959 in the northeast quadrant of the Pullman site and later filling was observed in progress in 1967 during the construction of Housing Development 4. The material used for filling could not be identified; it appeared to be light-toned, but it could not be determined what the nature of the material was or if any wastes were incorporated into this material. No evidence of the effluent ditch, referred to in the collateral information, was identified in the period of analysis.

The U.S. Environmental Protection Agency's Characterization Research Division's Monitoring Sciences Branch in Las Vegas, Nevada, prepared this report for the Agency's Hazardous Waste Management Division in Region 5 in Chicago, Illinois, and the Office of Emergency and Remedial Response in Washington, D.C.

INTRODUCTION

This report presents findings of an analysis of historical aerial photography spanning the period 1938 to 1976. The analysis was performed for the study area known as the Pullman Sewage Farm and the community of Altgeld Gardens in Chicago, Illinois. The study area consists of approximately 400 acres bordered on the north by 130th Street, on the east by the Calumet Expressway, on the south by the Little Calumet River, and on the west by Indiana Avenue. This analysis was requested by Region 5 to document the possible disposal of sewage sludge and landfilling operations that may have taken place before housing was built.

The collateral information supplied by Region 5 reports that the Pullman facility had been used as a site for the deposition of liquid wastes from 1881 to 1907. The following is a summary of the Pullman site background information supplied by EPA Region 5: The Pullman Sewage Farm was actively used as a disposal area for municipal waste for a span of sixteen years, from 1881 to 1907. The sludge consisted of municipal sewage and industrial waste associated with a railcar factory. It was transported through subterranean pipes from the town of Pullman in the north to a hydrant located on the farm, from which it was allowed to flow over the soil. Buried in the soil were three- to four-inch farm tiles which provided underdrainage for the filtration process. The untreated effluent flowed to ditches which then carried it to the Little Calumet River. In addition to being used to filter the sewage, the soil was also used by the Pullman Land Association to grow cash crops. Accounts published in 1893 documented eye-witness reports of the discharging of "crude sewage" into the Lake even prior to 1887. "The sewage was being run in a large open ditch...from near the farm to the lake [Calumet]". Reportedly this procedure was done to protect the cash crops being grown on the Pullman Sewage Farm.

The U.S. Environmental Protection Agency's Characterization Research Division's Monitoring Sciences Branch in Las Vegas, Nevada, prepared this report for the Agency's Hazardous Waste Management Division in Region 5 in Chicago, Illinois, and the Office of Emergency and Remedial Response in Washington, D.C.

METHODOLOGY

Stereoscopic pairs of historical aerial photographs were used to perform the analysis. Stereo viewing enhances the interpretation because it allows the analyst to observe the vertical as well as horizontal spatial relationships of natural and cultural features. Stereoscopy is also an aid in distinguishing between various shapes, tones, textures, and colors that can be found within the study area.

Evidence of waste disposal is a prime consideration when conducting a hazardous waste site analysis. Leachate or seepage resulting from burial and dumping of hazardous materials might threaten existing surface or ground-water resources. Pools of unexplained liquid are routinely noted because they can indicate seepage from buried wastes and may enter drainage channels that allow contaminants to move off the site. An excellent indicator of how well hazardous materials are being handled at a site is the presence or absence of spills, spill stains, and vegetation damage. Trees and other forms of vegetation that exhibit a marked color difference from surrounding members of the same species are labeled "stressed," "damaged," or "dead" based upon the degree of noticeable variation. Vegetation is so labeled only after consideration of the season in which the photography was acquired.

Drainage analysis identifies the direction a spill or surface runoff would follow. Direction of drainage is determined from analysis of the photographs and from U.S. Geological Survey topographic maps. Whenever they are available, 7.5-minute quadrangle maps (scale 1:24,000) are used to show site location and to provide geographic and topographic information. Site boundaries or areas used in this analysis were determined from observations made from aerial photographs in conjunction with collateral data supplied by Region 5 and do not necessarily denote legal property lines or ownership.

Results of the analysis are shown on annotated overlays attached to the photos. The following table provides documentation of the photographs used in this report:

TABLE 1. DOCUMENTATION OF AERIAL PHOTOGRAPHY

PHOTO ANALYSIS

NOVEMBER 14, 1938 (FIGURE 3)

Collateral information indicates that sewage disposal had ceased at the Pullman Sewage Farm in 1907. At this time, in the northwest quadrant of the Pullman Sewage Farm area, the ground appears to be undergoing railway demolition and road construction. At a bend of the Little Calumet River (which lies northwest of the study area) an outfall and dark plume are noted, but the source of the discharge is unknown. At the center of the Pullman Sewage Farm area there is a square lot with a building (Building 1); this lot is a location of a school in 1996. In the northeast quadrant of the Pullman Sewage Farm area the land is cleared and appears to be either turf or under cultivation. In the southeast quadrant of the study area there is a small lot with buildings which appears to be a farmstead (Annotation A). In the southwest quadrant of the Pullman Sewage Farm area a housing development (Housing Development 1) is extant and is comprised of three sections, each section contains approximately twenty structures. No evidence of waste disposal activity is noted.

MARCH 29, 1952 (FIGURE 4)

The northwest quadrant of the Pullman Sewage Farm area continues to be disturbed by construction activity. An exposed pipe is visible in this area. Much of the study area appears to be either turf or undergoing cultivation. Outside the northeast perimeter of the Pullman Sewage Farm area, there are drainage depressions leading toward the Pullman Sewage Farm area from the Altgeld Gardens housing development. The buildings denoted by Annotation A appear unchanged. No evidence of waste disposal is noted.

AUGUST 28, 1967 (FIGURE 6)

In the northwest quadrant of the study area there is a pipe trench extending from the road. Annotation B denotes the location of buildings inside the study area which seem to be a part of a nearby train depot. Buildings and a circular storage tank have been built on the location of the fill area previously noted in the northeast quadrant of the Pullman Sewage Farm area. In the southeast quadrant of the Pullman Sewage Farm area a housing development (Housing Development 2) has been built over the location of Annotation A (Figure 3); it is probably an expansion of the Altgeld Gardens housing development. A third housing development (Housing Development 3) is in the initial stages of construction, surrounding Building 1.

ABSTRACT

This report is an addendum to TS-PIC 9605510. It presents the results of an aerial photographic analysis of the Altgeld Gardens extended study area located in Chicago, Illinois. The Altgeld Gardens extended study area occupies approximately 570 acres and is comprised of two main areas, the Pullman Sewage Farm and the Altgeld Gardens Housing Development, which are separated by Lawrence Avenue. The primary data used for this report are two selected dates of black-and-white photographs: November 14, 1938 and September 3, 1959. This analysis was requested to document the possible disposal of sewage sludge and landfilling operations that may have taken place before housing was built in the Altgeld Gardens extended study area.

Findings from the analysis indicate evidence of a possible drainageway in the Altgeld Gardens Housing Development Area in 1938. The poor resolution of the photograph precludes a detailed description of the function of the possible drainageway. The landfilling operations that took place in 1959 at the Pullman Sewage Farm Area and at the Altgeld Gardens Housing Development Area appeared to be related to building construction. The material used for filling appeared to be light- to medium-toned. It could not be determined what the nature of the material was or if any wastes were incorporated into this material.

The U.S. Environmental Protection Agency's Characterization Research Division's Monitoring Sciences Branch in Las Vegas, Nevada, prepared this report for the Agency's Hazardous Waste Management Division in Region 5 in Chicago, Illinois, and the Office of Emergency and Remedial Response in Washington, D.C.

INTRODUCTION

This report presents the results of an aerial photographic analysis of the Altgeld Gardens extended study area located in Chicago, Illinois (Figures 1 and 2). The primary data used for this report are two selected dates of black-and-white photographs: November 14, 1938 and September 3, 1959.

The Altgeld Gardens extended study area occupies approximately 570 acres and is comprised of two main areas, the Pullman Sewage Farm and the Altgeld Gardens Housing Development, separated by Lawrence Avenue. The Pullman Sewage Farm Area consists of approximately 140 acres bordered on the north by 130th Street, on the east by Lawrence Avenue, on the south by 134th Street, and on the west by Indiana Avenue. Collateral information supplied by Region 5 indicates that it operated for sixteen years (1881-1907) as a disposal site of sewage sludge originating from the town of Pullman to the north and reportedly included a ditch which carried effluent to Lake Calumet (for a summary of the collateral information supplied by Region 5, please refer to previous report TS-PIC-9605510). The Altgeld Gardens Housing Development Area consists of approximately 430 acres bordered on the north by 130th Street, on the east by Lawrence Avenue, on the south by the Little Calumet River and on the east by the Calumet Expressway (note: the actual Altgeld Gardens housing development does not extend to the Calumet Expressway). This analysis was requested to document the possible disposal of sewage sludge and landfilling operations that may have taken place before housing was built in the Altgeld Gardens extended study area.

The U.S. Environmental Protection Agency's Characterization Research Division's Monitoring Sciences Branch in Las Vegas, Nevada, prepared this report for the Agency's Hazardous Waste Management Division in Region 5 in Chicago, Illinois, and the Office of Emergency and Remedial Response in Washington, D.C.

METHODOLOGY

Stereoscopic pairs of historical aerial photographs were used to perform the analysis. Stereo viewing enhances the interpretation because it allows the analyst to observe the vertical as well as horizontal spatial relationships of natural and cultural features. Stereoscopy is also an aid in distinguishing between various shapes, tones, textures, and colors that can be found within the study area.

Evidence of waste disposal is a prime consideration when conducting a hazardous waste site analysis. Leachate or seepage resulting from burial and dumping of hazardous materials might threaten existing surface or ground-water resources. Pools of unexplained liquid are routinely noted because they can indicate seepage from buried wastes and may enter drainage channels that allow contaminants to move off the site. An excellent indicator of how well hazardous materials are being handled at a site is the presence or absence of spills, spill stains, and vegetation damage. Trees and other forms of vegetation that exhibit a marked color difference from surrounding members of the same species are labeled "stressed," "damaged," or "dead" based upon the degree of noticeable variation. Vegetation is so labeled only after consideration of the season in which the photography was acquired.

Drainage analysis identifies the direction a spill or surface runoff would follow. Direction of drainage is determined from analysis of the photographs and from U.S. Geological Survey topographic maps. Whenever they are available, 7.5-minute quadrangle maps (scale 1:24,000) are used to show site location and to provide geographic and topographic information. Site boundaries or areas used in this analysis were determined from observations made from aerial photographs in conjunction with collateral data supplied by Region 5 and do not necessarily denote legal property lines or ownership.

Results of the analysis are shown on annotated overlays attached to the photos. The following table provides documentation of the photographs used in this report:

TABLE 1. DOCUMENTATION OF AERIAL PHOTOGRAPHY

ANALYSIS SUMMARY

The primary data used for this report are two selected dates of black-and-white photographs: November 14, 1938 and September 3, 1959. This analysis was requested to document the possible disposal of sewage sludge and landfilling operations that may have taken place before housing was built in the Altgeld Gardens extended study area.

Findings from the analysis of 1938 photographs indicated evidence of a possible drainageway in the Altgeld Gardens Housing Development Area, but the poor resolution of the photograph precluded a detailed description of the function of these features. The landfilling operations that took place in 1959 at the Pullman Sewage Farm Area and at the Altgeld Gardens Housing Development Area appeared to be related to building construction. The material used for filling appeared to be light- to medium-toned but it could not be determined what the nature of the material was or if any wastes were incorporated into this material.

PHOTO ANALYSIS

NOVEMBER 14, 1938 (FIGURE 3)

The first date of analysis shows the Pullman Sewage Farm Area after it was known to have last been in operation (circa 1907) and the Altgeld Gardens Housing Development Area prior to the building of the actual Altgeld Gardens housing development (circa 1952). At the Pullman Sewage Farm Area in the northwest quadrant the ground appears to be undergoing rail-line demolition and road construction. Building 1 is a square lot; this lot is the current location of a school. In the northeast quadrant the land is cleared and appears to be either turf or under cultivation. In the southeast quadrant is a small lot with buildings (Annotation A). In the southwest quadrant a housing development (Housing Development 1) is already extant and is comprised of three sections, where each section contains approximately twenty structures. At the Altgeld Gardens Housing Development Area extended, linear segments of a possible drainageway are discernible in the northwest and southeast quadrants, but the poor resolution of the 1938 photograph precluded a detailed description of the function of these features. The land is mostly cleared and continues to appear either turf or under cultivation, but with no discernible buildings. There are intermittent patches of larger vegetation and the general surface runoff flows south.

SEPTEMBER 3, 1959 (FIGURE 4)

Locations of features and/or structures previously reported on the 1938 photograph are annotated on this photograph to serve as reference points. The second date of analysis shows the extended study area 21 years later. At the Pullman Sewage Farm Area the northeast corner is a rectangular lot with a complex of buildings already extant. The remaining surface of the lot appears to be smoothed construction fill. Adjacent to this lot, but within the Altgeld Gardens Housing Development Area, a school is noted as already extant. Lawrence Avenue has been constructed along the eastern perimeter of the sector. At the Altgeld Gardens Housing Development Area the actual Altgeld Gardens housing development is extant. There are smoothed fill areas just north of 134th Street which indicate construction in progress.

1. Introduction

The United States Environmental Protection Agency (U.S. EPA) Southeast Chicago Site Assessment Team (SAT) requested the Superfund Division Emergency Response Branch (ERB) and the Superfund Division Technical Support Section (TSS) to assess the possible presence of soil contamination at the Altgeld Gardens Community (AGC) located in Chicago, Cook County, Illinois.

On-Scene Coordinator Charles Gebien and Keith Lesniak of U.S. EPA ERB were tasked to perform the site assessment and to determine if conditions are present at the AGC which present an imminent and substantial threat to public health and welfare and the environment. The Chicago Housing Authority (CHA) was advised of proposed assessment work and participated in sampling activities.

2. Background

2.1 Site Description

The Altgeld Gardens community (AGC) is a low-income housing development that is managed by the Chicago Housing Authority (CHA). The AGC is located near Interstate 94 and 130th Street, Chicago, Cook County, Illinois (Figure 2-1). The AGC is bounded on the north by 130th Street, on the south by the Little Calumet River, on the east by the Beaubien Woods, and on the west by St. Lawrence Avenue (Figure 2-2). Approximately 10,000 residents live in the AGC.

2.2 Site History

The AGC was constructed in approximately 1941, atop an agricultural area. Residents of the AGC have indicated that canals from the Pullman Sewage Farm carried sewage wastes from industrial areas north of the AGC, through the AGC, and southward to the little Calumet River, until the 1950s. Many residents complain that health problems including skin rashes and asthma are prevalent in the AGC. Two soil samples collected from the AGC as part of a 1990 U.S. EPA Site Screening Inspection (SSI) and 1994 Expanded Site Inspection (ESI) for the Pullman Sewage Farm identified elevated levels of PAHs, pesticides, and heavy metals in surface soil (Refer to Table 4-4). The Illinois Department of Public Health (IDPH) has recommended that additional soil testing is justified at the AGC, particularly in areas where children play. The contaminants of concern are pthalates, PCBs, PAHs, heavy metals, pesticides, and VOCs.

On July 18, 1996, OSC Gebien, U.S. EPA ERB, completed a Sampling QA/QC Work Plan (SWP) for sampling activities planned at the AGC. The sample locations that are included in the SWP were chosen by interviews with AGC leaders and are based on complaints of contamination in each of the locations. In August 1996, the U.S. EPA Characterization Research Division completed an aerial photographic analysis of the Pullman Sewage Farm and the AGC area. In November 1996, an addendum was added to further interpret historical drainage ways which appear in 1938 aerial photos of the AGC (Refer to Appendix A for the Aerial Photographic Analysis of Altgeld Gardens). The 1938 aerial photo shows the AGC property in cultivation prior to construction of housing units and depicts possible drainage ways.

3. Site Assessment

On July 18, 1996 OSC Charles Gebien and Keith Lesniak visited the AGC area, after a major storm event to observe and photo document possible flooding conditions. On July 22, 1996, OSC Gebien and Lesniak met at AGC with Mr. Fred Chang, P.E., Environmental Unit, CHA, to collect water samples from areas of chronic standing water within the AGC. Standing water samples were collected from seven locations (Figure 2-2) were collected from the following locations; Block 15 (SO1), Block 12 (SO5), Block 16 (SO6), Block 17 (SO7), Block 3 (SO2), Block 4 (SO3), Carver High School (SO9). Refer to Table 3-1 for further sample location and description information and to Appendix C for photographs taken during the flooding observation and water sampling activities. Sampling was conducted in level D protection. The samples were delivered to the U.S. EPA Central Regional Laboratory (CRL), Chicago, Illinois. The water samples were analyzed for ABN, pesticides/polychlorinated biphenyls (PCBs), volatile organic analytes (VOAs), metals, mercury, and cyanide.

On August 21, 1996 OSC Charles Gebien and Keith Lesniak returned to the AGC area, and met with Mr. Fred Chang, P.E., Environmental Unit, CHA, to collect soil samples from areas within the AGC which are suspected areas of contamination. Soil samples were collected from the surface of the ground at ten locations (Figure 2-2). Samples were collected from the following locations; Block 16 (S17), Block 17 (S18), Block 3 (S13), Block 4 (S14), Carver Primary School Courtyard on Corliss St (S21). Block 15 (S12), Block 12 (S16), Carver High School (S20), Block 11 (S15) and WIC Clinic (S19). Refer to Table 3-2 for additional sample description and location information and to Appendix C for photographs taken during the soil sampling activities. Sampling was conducted in level D protection. The samples were delivered to the U.S. EPA Central Regional Laboratory (CRL), Chicago, Illinois. The soil samples were analyzed for ABN, pesticides/PCBs, VOAs, metals, mercury, and cyanide.

On November 11, 1996, OSC Charles Gebien and Keith Lesniak returned to the AGC area, and met with Steve Peterson, Alan Gebien, and Tom Sedlacek. Mr. Fred Chang, CHA, was not present due to other obligations. The purpose of the visit was to investigate subsurface soils in historical drainage areas within the AGC, which were identified through aerial photographic analysis as potential routes of contamination from the former Pullman Sewage Farm. Four former drainage ways were chosen for Geoprobe sampling, and one Geoprobe boring was performed in each drainage way. Subsurface soil samples were collected from the four Geoprobe boring locations as shown in Figure 2-

2. Samples were collected as follows; Geoprobe I 2'-4' (S01), 4'-6'(S02), Geoprobe II 2'-4' (S03), 4'-6' (S04), 6'-8' (S11), Geoprobe III 2'-4' (S05), 4'-6' (S06), Geoprobe IV 2'-4' (S07), 4'-6' (S08) and 6'-8' (S09). Refer to Table 3-3 for further sample description and location information. Photographs were not taken during the Geoprobe soil sampling activities. Sampling was conducted in level D protection. The samples were delivered to the U.S. EPA Central Regional Laboratory (CRL), Chicago, Illinois. The soil samples were analyzed for ABN, pesticides/PCBs, VOAs, metals, mercury, and cyanide.

On March 25,1997, OSC Charles Gebien and Keith Lesniak returned to the AGC area, and met with Mr. Fred Chang, CHA. The purpose of the visit was to collect additional surface soil samples in Block 11, because elevated levels of PAHs were identified from our earlier surface soil sample in that block. Four samples were collected from a courtyard lawn area as follows: front of Unit 13055 (S01), front of Unit 1128 (S02), front of Unit 1114 (S03), and front of Unit 13073 (S04). Refer to Table 3-4 for further sample description and location information.

Table 3-1
Standing Water (Collected 7/22/96)
Sample Description

Sample No.	Appearance	Location
S01	Clear Water	Sample from lawn area near unit 1078 in Block 15. Photos 1-5
S02	Clear water	Sample from grassy area near unit 13034 in Block 3. Photos 18-20.
S03	Cloudy water	Sample from hose that was pumping flood water from basement of unit 13144 in Block 4. Photos 15-17.
S05	Clear water with mosquito larvae	Sample from lawn area in front of unit 1153 in Block 12, Photos 6-8.
S06	Clear water with mosquito larvae	Sample collected from lawn sidewalk area in front of units 706 and 708 in Block 16. Photos 9-11.
S07	Clear water with mosquito larvae	Sample from base of playground slide in back of unit 13221 in Block 17. Photos 12-14.
S09	Clear water with mosquito larvae	Sample from grassy ditch west of Carver High School in Beaubien Woods. Photos 21-24.

S03	Soil	Sample from grassy area in courtyard near unit 1114 in Block 11.
S04	Soil	Sample from grassy area in courtyard near unit 13073 in Block 11.

4. Analytical Results

The water samples, surface soil samples, and sub-surface samples were analyzed for ABN, pesticides/polychlorinated biphenyls (PCBs), volatile organic analytes (VOAs), metals, mercury, and cyanide. All samples were analyzed at the U.S. EPA Central Regional Laboratory (CRL), Chicago, Illinois.

Analytical results indicate that slightly elevated levels of PAH compounds may be present in the surface soils within the AGC area. PAH data is summarized for standing water, surface soils, and sub-surface soils in tables 4-1, 4-2, and 4-3. Refer to Appendix B for CRL analytical reports and corresponding QA/QC reviews.

5. Discussion of Potential Threats

Analyses of surface soils, sub-surface soils and standing water within the AGC indicate that although elevated levels of PAHs were identified in surface soils within block 11, the levels do not exceed the recommended removal action level (RAL) for total PAHs (500-1000 PPM total PAHs) established in the "Emergency Removal Guidelines". Information from this report is being reviewed by U.S. EPA for a health based risk assessment.

There are no conditions present in the areas assessed at the AGC that may present an imminent and substantial threat to public health and welfare and the environment, based on considerations set forth in paragraph (b) (2) of Section 300.415 (b) (2) of the National Oil and Hazardous Substances Contingency Plan (NCP).

6. Removal Activities

There were no conditions observed at the AGC during the site assessment which warrant a removal action.

FACT SHEET

Altgeld Murray Gardens

Chicago, Illinois

May 1998

Introduction

The United States Environmental Protection Agency (US EPA) in conjunction with the Chicago Housing Authority (CHA), has prepared this fact sheet to inform residents of US EPA's past sampling activities in the area, and to provide information regarding the results of these activities.

Background Information

Altgeld Gardens (AG) is located near Interstate 94 and 130th Street in Chicago, Illinois. AG is bounded on the north by 130th Street, on the south by the Little Calumet River, on the east by the Beaubien Woods, and on the west by St. Lawrence Avenue. AG houses 5,780 residents and is owned by the (CHA), but managed by a private company. The AG community was constructed during the years 1944-1952, atop an agricultural area. Residents of the area are concerned that canals from the Pullman Sewage Farm, located to the east of the complex, may have carried sewage wastes from industrial areas north of AG and southward to the little Calumet River until the 1950s. There was also a belief by some community residents that AG was built on a landfill.

Investigation History

☐ In 1990, at the community's request, US EPA conducted background soil sampling in AG as part of a Site Screening Inspection (SSI) of the Pullman Sewage Site. Background samples are taken in most areas where US EPA is conducting inspections in order to determine the extent of contamination.

☐ In 1994, subsequent soil samples were taken as a follow-up to the 1990 samples. US EPA identified elevated levels of polycyclic aromatic hydrocarbons (PAHs), pesticides, and heavy metals in some of the background samples from the Expanded Site Inspection (ESI) conducted for the Pullman Sewage Farm in 1994. PAHs are common by-products of combustion. Sources include cars, trucks, smokestacks, and even bar-b-ques.

☐ In 1996, US EPA observed and photo documented AG after a major storm event to identify possible flooding conditions. Water samples were then collected from seven locations in the area.

☐ In August 1996, US EPA also worked with CHA's environmental unit to collect soil samples at ten locations. The areas were selected after interviewing community leaders.

☐ In November 1996, US EPA investigated the subsurface soils in drainage areas on the site. Evidence from the aerial photos and soil samples do not indicate that there was transport of waste materials from the Pullman Sewage Farm to the Altgeld property.

☐ Finally, in March 1997, additional soil samples were collected in Block 11 (130th Place & Doty Avenue) because elevated levels of PAHs were identified from earlier surface soil sampling results. Four samples were collected from a courtyard lawn area in front of Units 1128 and 1114, and in front of several other street addresses.

Results

During EPA investigations in 1996 and 1997, water, surface soils, and sub-surface samples were collected from various location with Altgeld Murray Gardens. These samples were analyzed by the US EPA Central Regional Laboratory in Chicago for polychlorinated biphenyls (PCBs), volatile organic compounds (VOCs), semi-volatiles, and metals. Of the chemicals detected in these samples, PAHs and DDT pesticides were identified as chemicals that requires an evaluation for their potential health effects. DDT and DDE, were generally detected in very low levels in these samples. The highest detected level of DDT, at 31 parts per million (ppm) in Block 16. This level of DDT is not considered to be either an immediate or long-term health concern.

PAHs were detected at Altgeld Gardens in about 40 percent of the surface soil samples. The detected PAHs were generally at very low levels (<0.5 ppm for the most toxic PAH, benzo(a)pyrene (BaP)). The highest detected concentration of BaP was 2.5 ppm, which occurred in Block 11 (130th Place & Doty Avenue). The four additional samples collected in that area in March, 1997 did not detect BaP or any other PAH. These levels of PAHs are not considered to be an immediate health concern and are similar to levels found in studies of other urban areas. To confirm that these levels are representative of Chicago background levels, an additional investigation is planned to specifically evaluate the background levels of PAHs in various residential areas of Chicago and to compare those levels to those found at Altgeld Gardens.

To evaluate the potential for long term, chronic effects of exposure, a screening risk assessment was performed, using the maximum detected surface soil sampling data for the site. The risk assessment considered soil ingestion and dermal absorption as the most important pathways for exposure. Using very conservative methods for evaluated, dermal exposure to PAHs accounts for about 70 percent of the risk in our analysis. The objective of this assessment is to predict future risks of continuous lifetime exposure, rather than evaluate whether people may be affected by current exposure at the site. Using USEPA risk assessment methodology, the lifetime excess cancer risk for exposure to the highest concentration of PAHs ranged from 2 x 10 (2 out of 10,000 exposed individuals) to 3 x 10 (3 out of 1,000 exposed individuals). In interpreting these estimates, one should keep in mind these are risks that are likely to be very similar to those experienced in any other urban site. In addition, the sampling results, as well as aerial photos of the area, reveal no physical evidence that Altgeld Gardens was built on a landfill or evidence of industrial contamination in the surface soil.

Future Actions

At this time US EPA has determined that additional sampling in the Altgeld Gardens is not necessary because Altgeld Garden levels were similar to those identified in studies of other urban areas. However, US EPA is conducting a PAH and lead background study to verify PAH and lead background levels for the City of Chicago. Information gathered in this study will be used to help determine future cleanup action levels for urban sites in general.

GLOSSARY

Volatile Organic Compounds (VOCs) and **Semi-Volatile Organic Compounds (semi-VOC's)** - An organic (carbon-containing) compound that evaporates readily at room temperature. Examples of VOC's include dry cleaning fluid, lighter fluid, paint thinners and components of gasoline.

Pesticides - Substances or mixture thereof intended for preventing, destroying, repelling, or mitigating crop. EPA sets these levels well below the point where the compounds might be harmful to consumers.

DDT - the first chlorinated hydrocarbon insecticide (chemical name: Dichloro-Diphenyl-Trichloromethane). It has a half-life of 15 years and can collect in fatty tissues of certain animals. EPA banned registration and interstate sale of DDT for virtually all but emergency uses in the United States in 1972 because of its persistence in the environment and accumulation in the food chain.

Chicago, Illinois 60643

Re: Altgeld Gardens Housing Complex

Dear Mr. Jain:

This letter is written to you with a recommendation that the Chicago Housing Authority (CHA) take appropriate actions to reduce the potential exposure at the Altgeld Gardens Housing Complex to polynuclear aromatic hydrocarbons (PAHs) detected in surface soils.

As you know, U.S. EPA has been involved in various soil sampling activities at the Altgeld Gardens Property. The most recent sampling took place in 1996, after a request was made by the community to look into possible soil contamination. The results of the sampling effort were presented to community representatives, specifically Hazel and Cheryl Johnson, People for Community Recovery (PCR), and Keith Harley, Chicago Legal Clinic, on July 20, 1998, at the U.S. EPA's office. We also tried to invite a representative from the Altgeld Gardens Local Advisory Board, but attempts to contact Mrs. Wheeler yielded a phone message indicating that the line had been disconnected. In addition, Lisa Schneider and Jaote Wawatu from the CHA were also present at this meeting.

U.S. EPA could find no evidence of release of PAHs from specific sources, and suspects that atmospheric deposition from point, area, and mobile sources are most likely responsible for the contamination. A comparison of PAH levels detected at Altgeld Gardens to those found in other urban areas indicated that the Altgeld values were within the expected range. However, the highest value of 2.5 ppm has the potential to cause adverse health effects through dermal contact under certain exposure assumptions. While this level would not support a Superfund removal action, we believe it is prudent to take some common sense steps to reduce or eliminate the exposure pathway.

Recycled/Recyclable • Printed with Vegetable Oil Based Inks on 100% Recycled Paper (40% Postconsumer)

Therefore, U.S. EPA strongly recommen CHA, as property owner, take appropriate measures to reduce the residents' contact with PAH contaminated soils. Appropriate measures to reduce exposure could include establishing groundcover, such as placing wood chips over surface soils in play lots and/or planting grass in court yard areas where the elevated PAH levels were found. These activities will greatly reduce risk to children and adults by eliminating direct contact with contaminated soils. These measures may also result in the reduction of the PAH compounds through a natural process known as phyto-remediation. In addition, Northwestern Unliversity may shortly provide us with other options to reduce the exposure pathway.

U.S. EPA would also like to invite CHA to partner in a project that would address this issue at Altgeld Gardens by establishing and maintaining groundcover with community support. The project would consist largely of education and outreach activities to Altgeld Gardens residents, and other stakeholders, in order to address the PAH issue.

Should you have any questions or concerns, please feel free to contact Mardi Klevs, Greater Chicago Team Manager, at (312) 353-5490.

Sincerely yours,

Wm. E. Muno

Re: Altgeld Gardens Community

Dear Mr. Bishop:

As promised in the July 28, 2000, letters responding to your Freedom of Information Act request, we are writing to provide you with information concerning the potential analytical problems involving the United States Environmental Protection Agency's (U.S. EPA) Central Regional Laboratory, and U.S. EPA's proposal to conduct core sampling for Polychlorinated Biphenyls (PCBs) in the yards on the north side of the Dorothy Gautreax Child Parent Center, 975 E. 132nd Street, Chicago, Illinois (Gautreax Center), and surface soil and surface water sampling in the area throughout the community housing, as in the enclosed figure.

During the spring of 1996 the Chicago Housing Authority (CHA) conducted a cleanup of soil contaminated with PCBs, a chemical regulated under the Toxic Substances Control Act, from the yards on the north side of the Gautreax Center. The source of the PCB contamination was a storage lot located across the street from the Gautreax Center where the CHA had disposed PCBs from electrical transformers. During the cleanup, approximately one foot of soil was excavated across the entire north side of the Gautreax Center, cleanup confirmation samples were collected, and the area was backfilled with clean soil trucked in from off site. U.S. EPA, Region 5, conducted oversight of the CHA's cleanup and assisted the CHA by providing laboratory analysis of the CHA's samples. Based on the sample analysis, Region 5 determined that the PCB cleanup level of less than 10 parts per million (ppm) had been met, and the area could be backfilled to grade with clean soil.

During 1996 and 1997, U.S. EPA also conducted surface soil and water sampling in certain areas of the housing complex in response to residents' concerns with potential contamination. The surface soil samples and surface water samples were analyzed for a full range of contaminants. Low levels of polycyclic aromatic hydrocarbons (PAHs), mainly Benzo(a)pyrene and low levels of DDD, DDT and DDE, were found in the soil samples. Although results were below action levels, U.S. EPA recommended to the CHA that a grass cover be placed in areas where bare soil was present. This grass cover prevents direct contact with soil.

Since these actions, allegations of misconduct in the analysis of samples have been made regarding two employees of U.S. EPA's Central Regional Laboratory and two contract employees who analyzed samples for Region 5's Superfund Program. The Office of the Inspector General is conducting an investigation of the alleged misconduct which relates to failures to follow standard laboratory operating procedures. Because of these allegations, U.S. EPA has determined that data generated from samples analyzed by these individuals will not be relied on for its decisions. U.S. EPA has determined that two sampling events at the Gautreax Center resulted in final cleanup decisions based solely on analytical results which were provided by one of the analytical chemists in question. On April 23 and May 8, 1996, soil samples were collected for PCB analysis from the excavation on the north side of the Gautreax Center. These results are identified by data set numbers 960073 and 960084. Because the 1996 analyses were performed by one of the analytical chemists in question, U.S. EPA now considers these particular analytical results to be unreliable Even though U.S. EPA has reviewed the 1996 raw analytical data and cannot conclude that there was any failure to follow analytical procedures which caused the analytical results to be lower than target levels indicating a need for cleanup, U.S. EPA believes the most prudent course of action is to resample this area. U.S. EPA must emphasize that the north yards are covered by approximately one foot of clean soil and do not present a significant risk to children attending the Gautreax Center or to the nearby community. It should also be noted that no similar problems have been found with the cleanup at the Altgeld Gardens storage lot, which was completed last summer.

With regard to the Superfund sampling, data from the sampling events in soil and water were reviewed and only certain chemical analysis was performed by these individuals. This was the case for pesticides in water and soils and for organic contaminants in soils, identified by data set numbers 960131, 960152 and 970025. Therefore, all locations will need to be resampled by U.S. EPA. However, samples will only be analyzed for pesticides and volatile organic compounds.

U.S. EPA intends to conduct this sampling by the middle of September.

If you have questions, please contact Scott Cooper, for the PCB sampling at (312) 886-1332 and Rosita Clarke-Moreno at (312) 886-7251, for the Superfund soil and water sampling.

Sincerely,

Robert Springer

Re: Altgeld Gardens
Chicago, Cook County, Illinois
TDD: S05-0008-010
PAN: 0G1001SIXX

Dear Ms. Nabasny:

The United States Environmental Protection Agency (U.S. EPA) tasked the Superfund Technical Assessment and Response Team (START) contractor, Ecology and Environment, Inc. (E & E), under Technical Direction Document (TDD) S05-0008-010, to assist U.S. EPA Remedial Project Manager (RPM) Rosita Clarke-Moreno with a site assessment at the above referenced site. The purpose of the site assessment was to resample surface soil locations on the Altgeld Gardens Community (AGC) that were originally sampled by U.S. EPA in 1996 and 1997 and analyzed for polyaromatic hydrocarbons (PAHs) and pesticides. Analytical results from that sampling effort are suspect because the analyses were performed by the Central Regional Laboratory (CRL). Recent investigations have determined that certain analytical data, including pesticide analyses, generated by CRL at the time of the U.S. EPA Altgeld Gardens soil sampling event may be erroneous.

The AGC site is a housing development managed by the Chicago Housing Authority (CHA) located south of 130th Street just west of Interstate 94 in Chicago, Cook County, Illinois (Attachment A, Figure 1). The AGC is bounded on the north by 130th Street, on the south by the Little Calumet River, on the east by the Beaubien Woods forest preserve, and on the west by St. Lawrence Avenue. Approximately 10,000 residents live in the AGC.

The AGC was constructed in 1941 on former farm land and several backfilled ditches that may have contained industrial effluent and debris. Many residents of the AGC have complained that health problems, including skin rashes and asthma, are prevalent in the community. Two soil samples collected from the AGC property in 1990 during a U.S. EPA investigation identified elevated levels of PAHs, pesticides, and heavy metals in surface soil. The Illinois Department of Public Health recommended additional soil sampling on AGC property, particularly in areas where children play.

In 1996, at the request of community leaders, U.S. EPA conducted a site investigation of the AGC property, including sampling of soil and standing water, to determine whether hazardous materials were present due to reported landfilling in the area. Results of this sampling and analysis indicated PAHs, and

PAHs, and the pesticides DDT, DDD, and DDE as contaminants of concern. The U.S. EPA analytical pesticide data is given in Attachment B, Table 1. At one sample location, S17, in housing Block 16 (Attachment A, Figure 2), the concentrations of pesticides were found to be above Agency for Toxic Substances and Disease Registry (ATSDR) screening criteria. Maximum concentrations found were: DDT at 31,399 micrograms per kilogram (μg/kg), DDD at 5,841 μg/kg, and DDE at 31,595 μg/kg.

In April of 1999, START performed a more detailed round of surface soil sampling in the vicinity of Block 16, collecting 10 located samples plus one duplicate and one off-site background sample. Analytical results, detailed in a Letter Report dated May 28, 1999, revealed the presence of pesticides in every sample, including the background sample. In on-site soils, 4,4'-DDD ranged from 30 to 570 μg/kg; 4,4'-DDE ranged from 660 to 17,000 μg/kg; and 4,4'-DDT ranged from 340 to 7,900 μg/kg. Aldrin was detected in one sample at 32 μg/kg, and dieldrin was detected in one sample at 15 μg/kg.

Under the present TDD, RPM Clarke requested that START return to the AGC site, resample the 1996-1997 U.S. EPA surface soil locations, and have the samples analyzed for pesticides at a commercial laboratory. On October 4, 2000, START members Larry Lueck and Erin White mobilized to the site and collected 10 surface soil samples, as well as a duplicate of one sample, using site file information to determine the 1996-1997 locations as well as possible (Attachment A, Figure 2). Each sample was a grab sample collected from the surface to a depth of 2 to 3 inches with a stainless steel trowel. Where turf was present, attention was given to freeing soil from the grass roots to ensure that the surface was truly represented. The soil was then homogenized in a stainless steel bowl and packed into an 8-ounce wide-mouth glass sample bottle and stored on ice in a cooler. Trowels and bowls were decontaminated with Alconox solution and rinsed with commercial distilled water between samples. Dates, times, and locations of sample collection are given in Attachment B, Table 2. Attachment C presents photographs of each sample location.

START labeled each sample bottle with a unique sample number, and the date and time of collection, and shipped the samples with a completed chain of custody form to the Ecology and Environment, Inc., Analytical Services Center in Lancaster, New York, for analysis of pesticides and polychlorinated biphenyls (PCBs) under analytical TDD S05-0008-804.

A summary of the START analyses is given in Attachment B, Table 3, which also lists the U.S. EPA Region III risk-based concentrations (RBCs) for comparison. Various pesticides were detected in every soil sample in concentrations from near the respective detection limits to 25,000 μg/kg DDE and 16,300 μg/kg DDT in sample AGS1. Note that the same substances were detected at even higher levels in the U.S. EPA soil sample from the same location (Attachment B, Table 1). Of the analyses listed in Attachment B, Table 3, seven are above the respective RBCs. Although the RBCs are guidelines rather than absolute action levels, they should be considered in determining which sample locations deserve further action. The 16,300 μg/kg DDT in sample AGS1 is noteworthy as being more than ten times the RBC. In general it appears, from a comparison of the data, that the U.S. EPA sample results were higher than those of the START samples, although not in all cases. Original laboratory reports and the validation memorandum are presented in Attachment D.

This Letter Report completes the deliverable requirements of the TDD. If you should have any questions or require additional information, please contact our office.

Sincerely,

Larry Lueck

HEALTH CONSULTATION

October 2000 Soil Sampling

ALTGELD GARDENS

CHICAGO, COOK COUNTY, ILLINOIS

EPA FACILITY ID: ILD981098395

FEBRUARY 16, 2001

Prepared by:

Illinois Department of Public Health
Under a Cooperative Agreement with the
Agency for Toxic Substances and Disease Registry

BACKGROUND AND STATEMENT OF ISSUES

The U.S. Environmental Protection Agency (USEPA) requested that the Illinois Department of Public Health (IDPH) evaluate the public health hazards posed by exposure to contaminants detected in the soil at Altgeld Gardens in Chicago, Cook County, Illinois. IDPH has written two previous health consultations for soil sampling in Altgeld Gardens; however, due to data quality issues at the Central Regional Laboratory, USEPA contracted with Ecology and Environment (E & E) to collect surface soil samples from areas previously sampled [1].

Altgeld Gardens is a Chicago Housing Authority community of about 10,000 people on the southeast side of Chicago, Illinois (Attachment 1). Altgeld Gardens covers about 190 acres and is bordered on the north by 130th Street, on the south by 134th Street and the Little Calumet River, on the west by St. Lawrence Avenue, and on the east by the Beaulien Woods Forest Preserve. This land is north and west of a wetland area and was reportedly agricultural land before Altgeld Gardens was developed in 1941 [2].

In response to community concerns, USEPA conducted a site investigation at Altgeld Gardens in 1996. IDPH evaluated that data in a November 1998 health consultation and concluded, based on the limited information available, that no apparent public health hazard existed from exposure to the surface soil contamination detected. IDPH recommended that USEPA collect more surface soil samples near the sample with the greatest pesticide levels to confirm the elevated levels found and to more fully characterize the potential exposure in the area.

In April 1999, USEPA collected twelve soil samples near apartments along 134th Street on the southern edge of Altgeld Gardens. These recent samples were collected near the location of the greatest pesticide levels detected in the 1996 site investigation. IDPH concluded that no apparent public health hazard existed from exposure to the pesticide residuals detected in surface soil at Altgeld Gardens.

Most recently, E & E collected ten surface soil samples on October 4, 2000. The samples were collected from the top 2 to 3 inches of soil (Attachment 2) and were analyzed for pesticides by a private, certified laboratory.

DISCUSSION AND CHILD HEALTH STATEMENT

IDPH compared the results of each soil sample with the appropriate screening comparison value used to select contaminants for further evaluation for carcinogenic and non-carcinogenic health effects. Chemicals found at levels greater than comparison values or those for which no comparison value exists were selected for further evaluation. A discussion of each comparison value used is found in Attachment 3. Children are a sensitive sub-population, so special consideration is given to potential exposures to children in the toxicological evaluation.

DDT, DDE, and heptachlor epoxide were found at levels greater than comparison values in three of the ten samples (Table 1); however, DDT and DDE were found at higher levels in previous sampling.

Exceeding a comparison value does not necessarily mean that exposure to the chemical will cause adverse health effects. The potential for exposed persons to experience adverse health effects depends on:

- how much of each chemical to which a person is exposed,
- how long a person is exposed, and
- the health condition of the exposed person.

Residents can be exposed to the chemicals in the soil (Attachment 4). Routes of exposure include ingestion, dermal contact, and inhalation; however, exposure to contaminated soil is limited by the grass cover at the most contaminated sample locations [2].

If a child growing up in the community or an adult living in the community were exposed to chemicals at the highest levels detected in the soil, for nine months of each year, the estimated exposure would pose no apparent increased cancer risk. The estimated low level of exposure would also not be expected to cause any non-cancer health effects [3].

CONCLUSION

IDPH concludes that, based on the information reviewed, no apparent public health hazard exists from exposure to the pesticide residuals detected in surface soil at Altgeld Gardens.

EXECUTIVE SUMMARY

GSG Consultants, Inc. (GSG) was retained by Holabird & Root LLC, to conduct a hazardous materials building survey of the units associated with the Altgeld Gardens Blocks 11, 12 & 13. The site is located at 130th Street & Ellis Avenue in Chicago, Illinois. The survey included twenty-six (26) residential buildings with a total of 244 individual units that are to be renovated as part of this project. The purpose and scope of the survey was to identify the location and quantity of asbestos containing material (ACM), lead-based paint (LBP), mold, poly-chlorinated biphenyls (PCB), and Universal Waste that may be present in these units.

GSG performed the field survey in accordance with the Illinois EPA requirements and guidelines and standard industry practices. The surveys were conducted from June 29, 2009 to July 23, 2009. The work was performed by experienced project managers and technicians who are licensed by the Illinois Department of Public Health (IDPH) and have been involved in numerous renovation projects.

Asbestos-Containing Materials (ACM)

The asbestos survey identified the presence of friable and non-friable asbestos containing materials in the building. Materials that tested positive for asbestos content include: "9x9" floor tiles & mastic, "12x12" floor tiles & mastic, pipe insulation, and associated joint compound fittings, exterior door caulk, & window caulk, roof field & flashing, and transite pipe.

Lead-Based Paint Surfaces/Components/Materials

Lead-based paint was identified on exterior wooden window and door frames. The location, component, substrate, and condition of all lead-bearing surfaces tested are listed in Sections 3, 4, 5, 6 and 7 Tables 3.2, 4.2, 5.2, 6.2, and 7.2.

All painted surfaces / components including walls and ceilings inside the units tested **Negative** for lead-based paint throughout Blocks 11, 12 and 13.

Microbial Contaminated Material (Mold)

Suspect mold growth was identified in some of the units that were inspected during this survey. Water damage was also observed in most units in Blocks 11, 12 and 13.

Polychlorinated Biphenyls (PCBs) & Universal Waste

GSG Inspectors did not observe any fluorescent light fixtures or PCB ballasts during the survey.

Chemical Waste

GSG Inspectors did not observe any chemical waste on site during the survey.

Demographic Profile

Demographic Profile of Surrounding Area (3 Miles)

This section provides demographic information regarding the community surrounding the facility. ECHO compliance data alone are not sufficient to determine whether violations at a particular facility had negative impacts on public health or the environment. Statistics are based upon the 2010 US Census and American Community Survey data, and are accurate to the extent that the facility latitude and longitude listed below are correct. The latitude and longitude are obtained from the EPA Locational Reference Table (LRT) when available.

Radius of Area:	3	Land Area:	92%	Households in Area:	35,876
Center latitude:	41.65593	Water Area:	8%	Housing Units in Area:	42,064
Center Longitude:	-87.59864	Population Density:	4,012/sq.mi.	Households on Public Assistance:	1,668
Total Persons:	104,684	Percent Minority:	94%	Persons Below Poverty Level:	52,075

Race Breakdown	Persons (%)	Age Breakdown	Persons (%)
White:	9,987 (9.54%)	Child 5 years and younger:	7,467 (7.13%)
African-American:	89,337 (85.34%)	Minors 17 years and younger:	30,821 (29.44%)
Hispanic-Origin:	7,633 (7.29%)	Adults 18 years and older:	73,864 (70.56%)
Asian/Pacific Islander:	225 (.21%)	Seniors 65 years and older:	10,711 (10.23%)
American Indian:	288 (.28%)		
Other/Multiracial:	4,847 (4.63%)		

Education Level (Persons 25 & older)	Persons (%)	Income Breakdown	Households (%)
Less than 9th Grade:	2,864 (4.36%)	Less than $15,000:	7,362 (19.58%)
9th through 12th Grade:	8,404 (12.78%)	$15,000 - $25,000:	4,675 (12.43%)
High School Diploma:	20,150 (30.65%)	$25,000 - $50,000:	9,713 (25.83%)
Some College/2-yr:	25,129 (38.23%)	$50,000 - $75,000:	7,954 (21.16%)
B.S./B.A. or More:	9,187 (13.98%)	Greater than $75,000:	7,893 (20.99%)

Illinois Environmental Protection Agency

FOIA Request Received

Thursday, September 29, 2016

Ms. Renisa Kokoneshi
Carnow, Conibear & Assoc., Ltd
600 West Van Buren Street, Suite 500
Chicago, IL 60607

Requester Type: Other

Dear Renisa Kokoneshi,

We have received your request for information under the Illinois Freedom of Information Act. Listed below is a summary of what we received in your online request.

Please do not reply to this email. If you have questions about your request please call (217) 558-5101.

Request Summary

Received	9/29/2016 11:18:12 AM
Reference Id(s)	
Date Range	05/13/2014 - 09/29/2016
Request Narrative	CHA Altgeld Gardens Block 11, 12, & 13 - Chicago, IL Block 11: 1101-1171 E. 130th Pl. 13031- 13077 S. Greenwood Ave. 1100-1166 E. 131st St. Block 12: 13201-

13263 S. Greenwood Ave. 1101-1131 E. 132nd St. 1133-1167 E. 133rd St. Block 13: 1100-1166 E. 131st St. 13101-13107 S. Greenwood Ave. 1100-1158 E. 132nd St. Records of underground storage tanks (USTs), above ground storage tanks (ASTs), incident reports, hazardous materials incident reports and other records of environmental concern, for the addresses listed above for the period of May 13, 2014 up to date.

Re: Freedom of Information Act Request - 97053

Dear Ms. Kokoneshi:

This letter is in response to your Freedom of Information Act (FOIA) (5 ILCS 140/1 et seq.) request dated September 29, 2016 and received by the Illinois Environmental Protection Agency (Illinois EPA) on September 29, 2016.

Following a search, the Illinois EPA has determined there to be no information responsive to your request.

Requested Information			
1.	Property	1101 -1171 E 130th St	Chicago
2.	Property	1101 – 1158 132nd St	Chicago
3.	Property	13031 – 13263 S Greenwood St	Chicago
4.	Property	1100-1166 131st St	Chicago
5.	Property	1133 -1167 133rd St	Chicago

Thank you for your patience in this matter.

Sincerely,

Anwar Johnson

FOIA RESPONSE: 16-8562

Dear Ms. Kokoneshi:

Thank you for writing to the Chicago Fire Department with your request for information pursuant to the Illinois Freedom of Information Act, 5 ILCS 140/1 et seq.

On September 27, 2016 we received your request for the following:

> *Records of underground storage (UST's), above ground storage tanks (AST's), incident reports, hazardous materials incident reports and other records of environmental concern, for 1101-23 E. 131st St., CHA Altgeld Gardens Block 13, 13101 S. Greenwood Ave., 1125-47 E. 131st St., 1100-22 E. 132nd St., 1124-34 E. 132nd St., and 1136-58 E. 132nd St., 13201-23 S. Greenwood Ave., CHA Altgeld Gardens, Block 12 13241-63 S. Greenwood Ave., 1101-7 E. 132nd St., 1109-31 E. 132nd St.., 1133-43 E. 133rd St., 1132-42 E. 133rd St., and 1144-66 E. 133rd St., 1101-11 E. 130th Place, CHA-Altgeld Gardens, Block 11, 1113-35 E. 130th Pl., 1137-47 E. 130th Pl., 1149-71 E. 130th Pl., 13031-53 S. Greenwood Ave., 13055-77 S. Greenwood Ave., 1100-6 E. 131st St., 1108-30 E. 131st St., 1132-42 E. 131st St. and 1144-66 E. 131st St.*

Please be advised there are no records responsive to your requests.

Sincerely,
Cynthia Linzy
CFDFOIA@cityofchicago.org

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

EXECUTIVE SUMMARY

TARGET PROPERTY SEARCH RESULTS

The target property was not listed in any of the databases searched by EDR.

DATABASES WITH NO MAPPED SITES

No mapped sites were found in EDR's search of available ("reasonably ascertainable ") government records either on the target property or within the search radius around the target property for the following databases:

STANDARD ENVIRONMENTAL RECORDS

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA’s knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 03/07/2016 has revealed that there is 1 SEMS-ARCHIVE site within approximately 0.5 miles of the target property.

EXECUTIVE SUMMARY

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 06/27/2016 has revealed that there is 1 CORRACTS site within approximately 1 mile of the target property.

Federal RCRA generators list

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 06/21/2016 has revealed that there are 2 RCRA-SQG sites within approximately 0.25 miles of the target property.

CHICAGO, CITY OF	1100 E 130TH PL	NNW 0 - 1/8 (0.093 mi.)	3	9

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 06/21/2016 has revealed that there are 2 RCRA-CESQG sites within approximately 0.25 miles of the target property.

State and tribal landfill and/or solid waste disposal site lists

IL NIPC: NIPC is an inventory of active and inactive solid waste disposal sites, based on state, local government and historical archive data. Included are numerous sites that previously had never been identified largely because, prior to 1971, there was no obligation to register such sites. The data come from the Northeastern Illinois Planning Commission's Solid Waste Landfill Inventory.

A review of the IL NIPC list, as provided by EDR, and dated 08/01/1988 has revealed that there are 5

IL NIPC sites within approximately 0.5 miles of the target property.

State and tribal leaking storage tank lists

LUST: The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data come from the Illinois Environmental Protection Agency's LUST Incident Report.

A review of the LUST list, as provided by EDR, and dated 04/06/2016 has revealed that there is 1 LUST site within approximately 0.5 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 06/21/2016 has revealed that there is 1 RCRA NonGen / NLR site within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR Hist Cleaner: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR Hist Cleaner list, as provided by EDR, has revealed that there is 1 EDR Hist Cleaner site within approximately 0.125 miles of the target property.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

ACES (Illinois - Agency Compliance And Enforcement System) is the Illinois EPA Project to facilitate the permitting operations

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

ICIS (Integrated Compliance Information System) is the Integrated Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA’s programs. The vision for ICIS is to replace EPA’s independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 03/07/2016

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA’s Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA CORRACTS facilities list

CORRACTS: Corrective Action Report

CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

Date of Government Version: 06/27/2016	Source: EPA
Date Data Arrived at EDR: 06/30/2016	Telephone: 800-424-9346
Date Made Active in Reports: 09/02/2016	Last EDR Contact: 09/28/2016
Number of Days to Update: 64	Next Scheduled EDR Contact: 01/09/2017
	Data Release Frequency: Quarterly

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 06/21/2016	Source: Environmental Protection Agency
Date Data Arrived at EDR: 06/30/2016	Telephone: 312-886-6186
Date Made Active in Reports: 09/02/2016	Last EDR Contact: 09/28/2016
Number of Days to Update: 64	Next Scheduled EDR Contact: 01/09/2017
	Data Release Frequency: Quarterly

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 06/21/2016	Source: Environmental Protection Agency
Date Data Arrived at EDR: 06/30/2016	Telephone: 312-886-6186
Date Made Active in Reports: 09/02/2016	Last EDR Contact: 09/28/2016
Number of Days to Update: 64	Next Scheduled EDR Contact: 01/09/2017
	Data Release Frequency: Quarterly

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

Date of Government Version: 06/21/2016	Source: Environmental Protection Agency
Date Data Arrived at EDR: 06/30/2016	Telephone: 312-886-6186
Date Made Active in Reports: 09/02/2016	Last EDR Contact: 09/28/2016
Number of Days to Update: 64	Next Scheduled EDR Contact: 01/09/2017
	Data Release Frequency: Quarterly

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

Date of Government Version: 06/21/2016	Source: Environmental Protection Agency
Date Data Arrived at EDR: 06/30/2016	Telephone: 312-886-6186
Date Made Active in Reports: 09/02/2016	Last EDR Contact: 09/28/2016
Number of Days to Update: 64	Next Scheduled EDR Contact: 01/09/2017
	Data Release Frequency: Varies

Federal institutional controls / engineering controls registries

LUCIS: Land Use Control Information System

LUCIS contains records of land use control information pertaining to the former Navy Base Realignment and Closure properties.

Date of Government Version: 05/28/2015	Source: Department of the Navy
Date Data Arrived at EDR: 05/29/2015	Telephone: 843-820-7326
Date Made Active in Reports: 06/11/2015	Last EDR Contact: 08/12/2016
Number of Days to Update: 13	Next Scheduled EDR Contact: 11/28/2016
	Data Release Frequency: Varies

US ENG CONTROLS: Engineering Controls Sites List

A listing of sites with engineering controls in place. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health.

Date of Government Version: 05/09/2016	Source: Environmental Protection Agency
Date Data Arrived at EDR: 06/01/2016	Telephone: 703-603-0695
Date Made Active in Reports: 09/02/2016	Last EDR Contact: 08/31/2016
Number of Days to Update: 93	Next Scheduled EDR Contact: 12/12/2016
	Data Release Frequency: Varies

US INST CONTROL: Sites with Institutional Controls

A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

Date of Government Version: 05/09/2016	Source: Environmental Protection Agency
Date Data Arrived at EDR: 06/01/2016	Telephone: 703-603-0695
Date Made Active in Reports: 09/02/2016	Last EDR Contact: 08/31/2016
Number of Days to Update: 93	Next Scheduled EDR Contact: 12/12/2016
	Data Release Frequency: Varies

Federal ERNS list

ERNS: Emergency Response Notification System

Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.

Date of Government Version: 03/28/2016	Source: National Response Center, United States Coast Guard
Date Data Arrived at EDR: 03/30/2016	Telephone: 202-267-2180
Date Made Active in Reports: 05/20/2016	Last EDR Contact: 09/26/2016
Number of Days to Update: 51	Next Scheduled EDR Contact: 01/09/2017
	Data Release Frequency: Annually

State- and tribal - equivalent CERCLIS

SSU: State Sites Unit Listing

The State Response Action Program database identifies the status of all sites under the responsibility of the Illinois EPA’s State Sites Unit.

Date of Government Version: 06/09/2015	Source: Illinois Environmental Protection Agency
Date Data Arrived at EDR: 07/29/2015	Telephone: 217-524-4826
Date Made Active in Reports: 09/01/2015	Last EDR Contact: 07/29/2016
Number of Days to Update: 34	Next Scheduled EDR Contact: 11/07/2016
	Data Release Frequency: Semi-Annually

State and tribal landfill and/or solid waste disposal site lists

CCDD: Clean Construction or Demolition Debris

Construction and demolition (C and D) debris is nonhazardous, uncontaminated material resulting from construction, remodeling, repair, or demolition of utilities, structures, and roads.

Date of Government Version: 04/11/2016	Source: Illinois EPA
Date Data Arrived at EDR: 04/12/2016	Telephone: 217-524-3300
Date Made Active in Reports: 06/10/2016	Last EDR Contact: 07/13/2016
Number of Days to Update: 59	Next Scheduled EDR Contact: 10/24/2016
	Data Release Frequency: Varies

LF WMRC: Waste Management & Research Center Landfill Database

The Waste Management & Research Center Landfill Database includes records from the Department of Public Health, Department of Mines & Minerals, Illinois Environmental Protection Agency, State Geological Survey, Northeastern Illinois Planning Commission and Pollution Control Board.

Date of Government Version: 12/31/2001	Source: Department of Natural Resources
Date Data Arrived at EDR: 10/06/2006	Telephone: 217-333-8940
Date Made Active in Reports: 11/06/2006	Last EDR Contact: 09/18/2009
Number of Days to Update: 31	Next Scheduled EDR Contact: 12/28/2009
	Data Release Frequency: No Update Planned

SWF/LF: Available Disposal for Solid Waste in Illinois - Solid Waste Landfills Subject to State Surcharge

Solid Waste Facilities/Landfill Sites. SWF/LF type records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. Depending on the state, these may be active or inactive facilities or open dumps that failed to meet RCRA Subtitle D Section 4004 criteria for solid waste landfills or disposal sites.

Date of Government Version: 12/31/2014	Source: Illinois Environmental Protection Agency
Date Data Arrived at EDR: 07/29/2015	Telephone: 217-785-8604
Date Made Active in Reports: 09/15/2015	Last EDR Contact: 07/26/2016
Number of Days to Update: 48	Next Scheduled EDR Contact: 11/07/2016
	Data Release Frequency: Annually

LF SPECIAL WASTE: Special Waste Site List

These landfills, as of January 1, 1990, accept non-hazardous special waste pursuant to the Illinois EPA Non-Hazardous Special Waste Definition. List A includes landfills that may receive any non-hazardous waste, Non-Regional Pollution Control Facilities are so noted. List B includes landfills designed to receive specific non-hazardous wastes. List B landfills are designated as a Regional Pollution Control Facility by RPCF, or Non-Regional Pollution Control Facility by Non-RPCF.

Date of Government Version: 01/01/1990
Date Data Arrived at EDR: 06/17/2009
Date Made Active in Reports: 07/15/2009
Number of Days to Update: 28

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Other Ascertainable Records

RCRA NonGen / NLR: RCRA - Non Generators / No Longer Regulated

RCRAInfo is EPA’s comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006	Source: Environmental Protection Agency
Date Data Arrived at EDR: 03/01/2007	Telephone: 202-564-2501

Data Release Frequency: Varies

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

HWAR: Hazard Waste Annual Report

Each year, Illinois hazardous-waste generators tell the Illinois EPA the amounts and kinds of hazardous waste they produced during the previous year. Generators indicate by code the types of wastes produced and the steps they took to manage these wastes. If some or all of these wastes were sent to commercial treatment, storage, and disposal facilities (TSDFs), that information and the identity of each receiving facility also are submitted. Illinois TSDFs likewise report the types and quantities of wastes received from in-state and out-of-state generators; they also report the procedures they used to manage these wastes.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historic Gas Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association’s annual survey of hospitals.
Medical Centers: Provider of Services Listing

TARGET PROPERTY ADDRESS

ALTGELD GARDENS BLOCKS 11, 12, & 13
NORTHEAST CORNER OF GREENWOOD AVE AND 133RD ST
CHICAGO, IL 60827

TARGET PROPERTY COORDINATES

Latitude (North):	41.656342 - 41˚ 39’ 22.83’’
Longitude (West):	87.594218 - 87˚ 35’ 39.18’’
Universal Tranverse Mercator:	Zone 16
UTM X (Meters):	450522.9
UTM Y (Meters):	4611579.0
Elevation:	586 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5681452 LAKE CALUMET, IL
Version Date:	2012

EDR’s GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principal investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

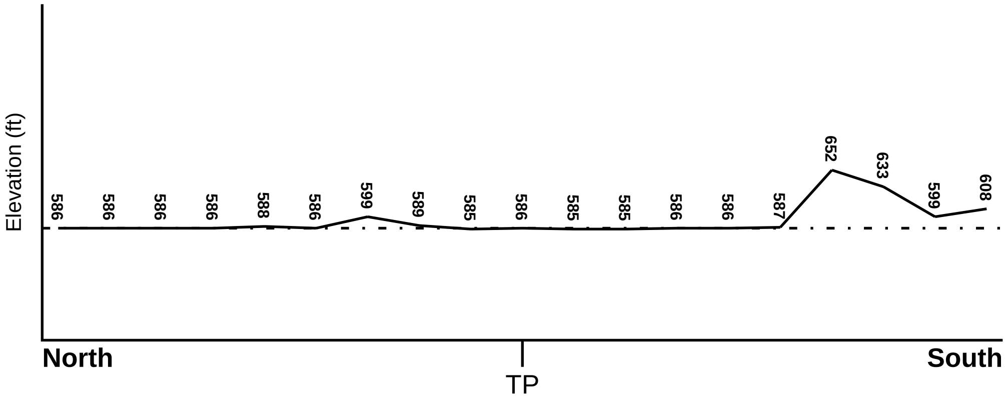
TOPOGRAPHIC INFORMATION

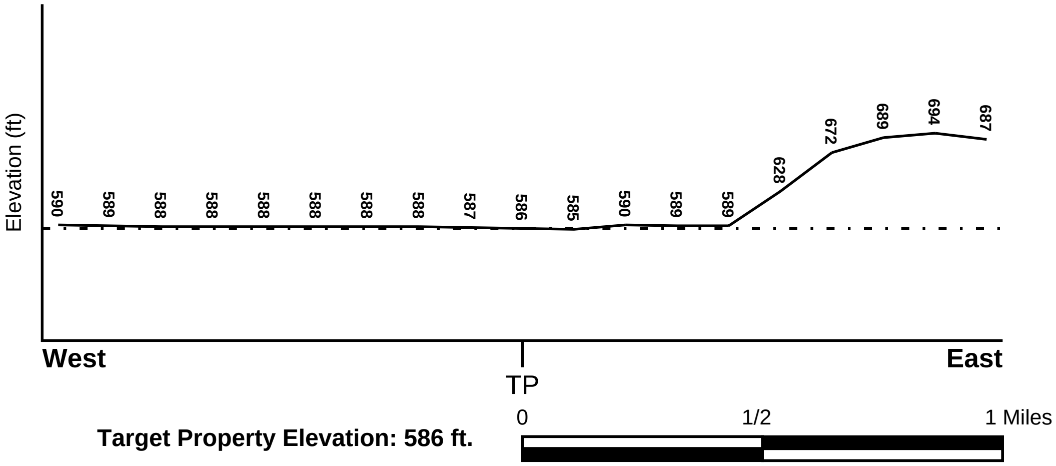
Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES





Target Property Elevation: 586 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
17031C0661J	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
17031C0662J	FEMA FIRM Flood data

17031C0663J	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
LAKE CALUMET	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Location Relative to TP:	1/2 - 1 Mile SSW
Site Name:	Land & Lakes #2
Site EPA ID Number:	ILD981531882
Surficial Aquifer Flow Dir.:	N TOWARD THE LITTLE CALUMET RIVER.
Measured Depth to Water:	not available.
Hydraulic Connection:	While a hydraulic connection between the near-surface lacustrine and glacial drift deposits aquifer and the underlying Silurian Dolomite bedrock aquifer is unlikely, a downward vertical ground water flow is present.
Sole Source Aquifer:	No information about a sole source aquifer is available
Data Quality:	Information based on site-specific subsurface investigations is documented in the CERCLIS investigation report(s)

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

For additional site information, refer to Physical Setting Source Map Findings.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT		**GEOLOGIC AGE IDENTIFICATION**	
Era:	Paleozoic	Category:	Stratifed Sequence
System:	Silurian		
Series:	Middle Silurian (Niagoaran)		
Code:	S2 *(decoded above as Era, System & Series)*		

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture’s (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name:	URBANLAND
Soil Surface Texture:	variable
Hydrologic Group:	Not reported
Soil Drainage Class:	Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel:	Not Reported
Depth to Bedrock Min:	> 0 inches
Depth to Bedrock Max:	> 0 inches

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	60 inches	variable	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures:	silt loam fine sandy loam loam fine sand
Surficial Soil Types:	silt loam fine sandy loam loam fine sand
Shallow Soil Types:	sandy loam
Deeper Soil Types:	silt loam sand loamy sand loam

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Illinois State Geological Survey
Telephone: 217-333-4747

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

State Database: IL Radon
Source: Department of Nuclear Safety
Telephone: 217-785-9958
County Radon Results

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

Appendix H

Qualifications of the Environmental Professionals

Nohemi Melero

Environmental Specialist

Nohemi Melero performs performs and oversees environmental engineering, site remediation, and environmental site investigation projects. She performs Phase I Environmental Site Assessments, hazardous materials surveys, and oversees UST removals and groundwater investigations.

EXPERIENCEN

11 years experience in environmental consulting services.

EDUCATION

BS, Environmental Science
Roosevelt University, Chicago, Illinois

PROFESSIONAL LICENSES/REGISTRATION

Hazardous Waste Operations and Emergency Response 29 CFR 1910.120 - Trained
Confined Space Training - OSHA 29 CFR 1910.146 - Trained

PROJECT EXPERIENCE

Various Private Clients
Perform numerous Phase I Environmental Site Assessments to assist clients in purchasing decisions of various properties. Perform site inspections, review background information, title searches, reviews of Freedom of Information Act (FOIA) requests, zoning, Sanborn, aerial, wetland, flood zone, regulatory databases, and USGS maps regarding site history, geology, hydrology, and potential contaminant migration pathways. Evaluate potential sources of environmental concerns and provide recommendations.

General Services Administration (GSA)
Perform expanded-scope Phase I Environmental Site Assessments for federal buildings investigations. In addition to standard ASTM Phase I ESA requirements, the assessments followed the NEPA protocol and incorporated air, water, land, sound, and other environmental impacts and included a recommendation if necessary.

Chicago Housing Authority/City of Chicago Department of Environment
Remediation Oversight
Performed oversight activities for former Henry Horner Homes housing project. Oversaw site remediation activities including the removal of impacted soil and the construction of engineered barriers.

Public Building Commission of Chicago
Performed Phase I and II Environmental Site Assessments for the PBCC in the development of sites for libraries. Assessed sites contaminated by previous use, USTs and ASTs.

South West Area Middle School
Performed oversight of site remediation including the removal of impacted soil and installation of engineered barriers.

Layser and Freiwald
Conducted residential well sampling and assisted in soil sampling for a large ongoing lawsuit regarding groundwater and soil contamination to a residential area. Sampled 20 residential sites for groundwater and 5 agricultural areas for soil contamination. Screened groundwater samples for temperature and turbidity.

AIG
Reviewed numerous Phase I and II ESAs and various documents and summarized the recognized environmental conditions, concerns, and conclusions.

City of Gary/Department of Environmental Affairs
Assisted in the preparation of a Quality Assurance Project Plan for the former International Bridge Corporation site as part of the City of Gary's Brownfield Redevelopment program.

Forest Preserve District of DuPage County
Oak Meadows Golf Course
Performed oversight of UST removal activities including the removal of impacted soils. Took confirmatory soil samples to verify extent of contamination. Completed an UST Summary Report for the site.

Homeowners and Rental Properties, Illinois
Conducted radon testing in numerous residences and rental properties related to proactive air quality testing.

Chicago 2016
Conducted a hazardous materials investigation of various Michael Reese Hospital buildings. Investigated turn-of-the century buildings for the presence of hazardous materials such as PCBs, mercury, drums, etc.

Chicago Department of Health
Conducted respirator fit testing on several CDH employees. Oversaw proper fit using Bitrex solution.

David S. Bremer, CHMM, REM

Director, Environmental Engineering Services

David Bremer directs a staff of professional engineers, professional geologists, environmental scientist/specialists, computer aided drafting technicians, and industrial hygienists in the performance of environmental site investigations, environmental design and engineering, Site Remediation Program (SRP) investigations and reporting, Leaking Underground Storage Tank (LUST) removals, closures and reimbursements, geotechnical evaluations, geophysical investigations, construction and demolition management, as well as asbestos, lead and various other environmental investigations and clean-ups. He prepares and evaluates proposals for department and inter-company departments. He performs quality control/quality assurance and also serves as Project Executive on projects. He serves as principal contact with clients, architects, designers, construction managers, and regulatory agencies. He assists in negotiations regarding clean-up costs with sellers, buyers, developers, and governmental agencies.

EXPERIENCE

20 years performing environmental consulting services, including: conducting over 200 Phase I and II ESAs; investigating and reporting numerous LUST and SRP sites; preparing remediation design packages of residential, commercial and public buildings and facilities; managing large remediation projects; managing remediation, demolition and construction management activities for new developments; and managing other types of environmental and industrial hygiene projects.

EDUCATION

BS, Industrial Engineering Technology
Southern Illinois University, Carbondale, Illinois
AS, Highway Engineering Technology
Morrison Institute of Technology, Morrison, Illinois

PROFESSIONAL CERTIFICATIONS

Certified Hazardous Materials Manager
Recognized Environmental Manager
Asbestos Inspector/Management Planner – IDPH
Lead Inspector – IDPH
40-Hour OSHA HAZWOPER
8-Hour OSHA HAZWOPER Supervisor

PROJECT EXPERIENCE

City of Chicago Department of Environment
Environmental Engineering Services – Various Residential, Commercial, and Industrial Sites
Managed projects and performed quality control/quality assurance for Phase I and II Environmental Site Assessments, UST removals and closure reporting, Site Remediation Program investigations and reporting, and environmental remediation for numerous city projects. Prepared remediation cost estimates for abatement, UST removals, and soil and groundwater remediation, asbestos abatement, demolition for future development of the contaminated sites. Managed the assessments and remediation of sites contaminated by previous use including PNAs, Inorganics, PCBs, solvents, USTs and ASTs. Enrolled sites in the IEPA's Site Remediation Program. Prime contact for interface with regulatory agency and City. Principal liaison between the DOE, other City agencies, and developers. Assisted the City in obtaining *No Further Remediation* letters for numerous sites.

Public Building Commission of Chicago
Environmental Engineering Services – Various Residential and Commercial Sites
Project Executive for Phase I, II Environmental Site Assessments, Site Remediation Program reporting, remediation design, and remediation oversight activities. Recent PBCC projects include development of sites for the District 7 Police Station, Engine Companies 18, 70, and 121, Humboldt Library, Taylor Lauridsen Park, and Southwest Area Middle School. Worked with Architects of Record and PBCC to prepare design plans to remediate sites as part of redevelopment. Prepared remediation design bid packages for Site Prep activities as well as development phases of the projects. Principal contact between PBCC/PMO Owners Representative/Construction Manager, and Contractor for all remediation design and construction issues. Conducted review of design project submittals and assisted with Contractor pay application review. Enrolled various sites in IEPA's Site Remediation Program. Managed both on-site oversight staff and office report preparation staff. Performed quality control and quality assurance for all SRP and/or LUST reports. Assisted the PBCC in obtaining *No Further Remediation* letters for numerous sites. Managed overall budget for consultant and subcontractor activities.

City of Chicago Department of Aviation
Environmental Engineering and Asbestos Abatement Services – Midway Airport Terminal Development Program
Managed and performed Phase I and II ESAs, Phase III Remedial Design, demolition/construction oversight, and review of contractor's submittals. Compiled assessment and investigation data from numerous sites prepared by Carnow Conibear as well as data from reports prepared by others to prepare design plans and technical specifications for the proposed development. The remediation design plans included removal of ASTs, USTs, asbestos, lead paint, PCBs, universal wastes, and the removal and disposal of hazardous materials. Environmental design and construction management for eleven design packages performed as part of the MATDP. Several of the packages had overlapping work performed under separate bid packages by separate contractors. Served as principal contact and field manager as representative of the DOA on all environmental issues for over four years during the redevelopment phases of the project. Managed several engineers and specialist that documented the construction, abatement, UST removal, and remediation activities. Managed the budget and performed quality control and quality assurance during project phases.

City of Chicago Department of Aviation
Hazardous Waste Remediation Project
O'Hare International Airport Acquisition Area – O'Hare Modernization Program
Served as Project Executive/Senior Project Manager for the $6.2 million remediation of three parcels of acquired land. Project included the *in-situ* stabilization and removal of 82,000 tons of hazardous waste, 33,000 tons of special waste, 50,500 gallons of impacted groundwater, and replacement of 34,000 tons of backfill. All remediation work was required to be completed in 75 days before a scheduled ground breaking ceremony by the Mayor of Chicago for the OMP. All requested mercury hazardous waste removal, hazardous waste lead treatment and removal as well as petroleum special waste removal work requested to be removed by the City was completed by the deadline. Project also included the removal of a UST and numerous scrap tires encountered during the progression of work and changing backfill material due to other OMP design plan changes. Managed the overall budget and a staff of two field personnel and two office engineers throughout the duration of the project. Managed the preparation of a Remedial Action Completion Report and UST Corrective Action Completion Report.

City Colleges of Chicago
Geotechnical and Environmental Investigations
Student Services/Parking Facility Development
Managed the environmental and geotechnical investigations for a new six-story building/parking facility. The project included performing over 30 soil borings and installation of monitoring wells. Many of the borings were advanced into bedrock to 109 feet and included rock coring and vane shear testing. The soil and groundwater physical and analytical laboratory data were evaluated for environmental impact and geotechnical characteristic. Managed the preparation of four overlapping remediation design packages for the development of the site with associated roadways and landscaping. Currently managing the design submittal review activities and remediation oversight activities.

Chicago Department of Aviation
Phase I, II, and III Environmental Site Assessments, Asbestos Surveys, AST Removal
Managed the performance of Phase I, II, and III ESAs at former Meigs Field Airport as part of closure plan. Project included laboratory data from 80 soil borings and incorporation of data from former investigations. Reports included Tier 3 PNA background study. Removed several ASTs. Performed asbestos surveys on several buildings. Served as primary contact of the DOA in discussions with the DOE and Chicago Park District.

Chicago Department of Aviation
Underground Storage Tank Facility Decommission and Removal
Managed the $1.2 million aircraft fueling facility decommissioning at Midway Airport. Removed USTs from 3 facilities, excavated 5,700 cubic yards of soil, and replaced 10,000 tons of fill. Installed acoustic sound wall, security fence, asphalt pavement, piping system, and sewer. Prepared all paperwork to secure an NFR letter from the IEPA for all sites.

City of Chicago Department of Aviation/O'Hare Partners
Quality Control/Quality Assurance – International Airport World Gateway Program
Performed QA/QC of Phase I and Phase II ESAs and remedial design estimates for the Design/Build contractor's submittals. Responsibilities also included managing environmental investigation of proposed new locations for existing facilities that were scheduled to be displaced by the Terminal 6 project. Assessments included reviewing soil and groundwater investigation data from over 100 soil borings and monitoring wells. Prepared detailed report of review for the DOA and O'Hare Partners.

1.0 Executive Summary

This report presents the results of the Carnow, Conibear & Assoc., Ltd. (Carnow Conibear) Phase I Environmental Site Assessment (ESA) investigation of Blocks 11, 12, and 13 of the Altgeld Gardens public housing project located at the northeast corner of South Greenwood Avenue and East 133rd Street in Chicago, Illinois (subject site). The subject site buildings are currently unoccupied. The Phase I ESA consisted of a visual site inspection, a historical records review, a review of public record documents, and a review of government agency records. The Phase I ESA was conducted in accordance with the American Society for Testing and Materials Standard E 1527-13 (Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process).

A visual inspection was conducted at the subject site on May 28, 2014. The subject site consists of 26 vacant two-story brick buildings, an electrical building, parking lots, sidewalks, and landscape areas. Based upon historical sources, the subject site had been agricultural land in 1938. By 1945, the subject site was developed with 26 residential buildings, sidewalks, and landscape areas. The electrical building was added to the subject site by 2007. The property has remained relatively unchanged until the time of this assessment.

The subject site was listed in the environmental databases consulted for this ESA. Federal, state, and local agencies accessed during the assessment revealed records of environmental concern in connection with the subject site. This assessment has revealed no evidence of Recognized Environmental Conditions (RECs) in connection with the subject site, except for the following:

- The presence of four incinerators on the subject site. The incinerators were used to burn garbage from the 1940's until their use was terminated in the 1970's. The burning of garbage in the incinerators over that period could contribute contamination from ash, spills, or leaching to the immediate vicinity, and therefore the incinerators are considered a Recognized Environmental Condition to the subject site.

The following were found to be *de minimis* conditions, defined as conditions that are not RECs and generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies:

- In 1996 and 2000, soil samples were collected from the subject site and analyzed for pesticides. One soil sample from Block 12 contained concentrations of pesticides that exceeded the SROs promulgated in 35 IAC 742, also known as *Tiered Approach to Corrective Action Objectives* (TACO). The Illinois Department of Public Health reviewed the sampling data and prepared the February 16, 2001 Health Consultation letter. The IDPH concluded that no apparent public health hazard exists from exposure to the pesticide residuals detected in surface soil. Therefore, the concentrations of pesticides detected in the 1996 and 2000 sampling events in Blocks 11, 12, and 13 can be considered a de minimis condition to the subject site, as defined in Section 3.2.22 of ASTM E1527-13. If soil is excavated from the areas where concentrations exceeded SROs, the soil should be handled and/or disposed of properly. In 2009, additional soil samples were collected from the subject site. Twenty-four of 122 soil samples contained

PNAs and/or arsenic that exceeded the SROs promulgated in 35 IAC 742. Carnow Conibear performed a 95% Upper Confidence Limit (UCL) evaluation of the data pursuant to 35 IAC 742.225(d) and (e). The objective of this evaluation was to determine whether the resulting 95% UCL concentration of each analyte, as derived from the data/results (sample population), is less than the corresponding applicable Tier 1 residential ingestion SRO. The results of this analysis indicate that each 95% UCL concentration is below the corresponding applicable Tier 1 residential ingestion SRO (or median background concentration) for each respective analyte. Therefore, the concentrations of PNAs and arsenic detected in the July 2009 GSG sampling event can be considered a de minimis condition to the subject site, because the concentrations do not generally present a threat to human health or the environment and generally would not be the subject of an enforcement action if brought to the attention of the appropriate governmental agencies, as defined in Section 3.2.22 of ASTM E1527-13. If soil is excavated from the areas where concentrations exceeded SROs, the soil should be handled and/or disposed of properly. USEPA recommended that CHA reduce residents' contact with PAH contaminated soils, including establishing groundcover, placing wood chips, and planting grass.

With respect to the ASTM standard, there were limitations associated with this Phase I ESA. Limitations included:

- Due to flooding, the basement and crawl space areas of the subject site were inaccessible at the time of site inspection.

The Executive Summary is intended to provide a brief summary of the findings of the recent site investigation. The entire report must be read in order to fully understand the findings and potential environmental concerns associated with the subject site; therefore, the Executive Summary should not be substituted in lieu of reading the entire report.

2.0 Introduction

2.1 Purpose

The Chicago Housing Authority (CHA) retained Carnow, Conibear & Assoc., Ltd. (Carnow Conibear) to perform a Phase I Environmental Site Assessment (ESA) of the property associated with Blocks 11, 12, and 13 of the Altgeld Gardens housing project located at the northeast corner of South Greenwood Avenue and 133rd Street in Chicago, Illinois (subject site). The purpose of the Phase I ESA was to obtain and evaluate information related to any Recognized Environmental Conditions (RECs) that might be present on the subject site.

2.2 Detailed Scope of Service

The Phase I ESA was performed for the subject site in accordance with the current American Society of Testing Materials (ASTM) Standard E 1527-13 (Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process). The following activities were conducted:

- A visual investigation of the subject site;
- Visual inspection of at least 10% of the building units;
- Interview with the site representative;
- Interview with the Phase I ESA User;
- Review of topographic, soils, and floodplain data;
- Review of United States Geological Survey (USGS) maps;
- Review of historic Sanborn Fire Insurance Maps;
- Review of historic city directory listings;
- Review of accessible government/public records;
- Review of local, state and federal databases; and
- A limited inspection of the adjacent properties from vantage points accessible to the public.

2.3 Significant Assumptions

With respect to the ASTM standard, there were no significant assumptions associated with this Phase I ESA.

2.4 Limitations & Exceptions

With respect to the ASTM standard, there were limitations associated with this Phase I ESA. Carnow Conibear was unable to inspect the basement areas of the buildings due to flooding.

2.5 Special Terms & Conditions

With respect to the ASTM standard, there were no special terms or conditions involved in this Phase I ESA.

2.6 User Reliance

No environmental site assessment can wholly eliminate uncertainty regarding the potential for RECs in connection with a property. This Phase I ESA, in accordance to ASTM Standard E 1527-13, is intended to reduce, but not eliminate, uncertainty regarding the potential for RECs for the subject site, given reasonable limits in time and cost. Based solely upon the work performed in connection with this Phase I ESA Report, which has taken into account commonly known and reasonably ascertainable information, and subject to all conditions and exceptions set forth in this report, the following entity can rely on this report when assessing environmental conditions pertaining to the subject site:

Chicago Housing Authority
60 East Van Buren, 13th Floor
Chicago, IL 60605

No other party may rely on this Phase I ESA without the prior express written consent of Carnow Conibear.

3.0 Site Description

3.1 Site Location

The subject site is located on the northeast corner of South Greenwood Avenue and E. 133rd Street in Chicago, Illinois. The subject site is bounded by E. 130th Place, beyond which is TCA Health Clinic and its associated parking lot to the north, E. 130th Place, an urban garden, E. 133rd Street to the east, E. 133rd Street to the south, and S. Greenwood Avenue to the west. According to the United States Geological Survey (USGS) Topographic Map Lake Calumet, Illinois dated 1997, the subject site is located in Section 35, Township 37 North, Range 14 East of the Third Principal Meridian in Cook County, Illinois. The Property Index Number (PIN) associated with the subject site is 25-35-100-019-0000. **Appendix A** presents the location of the subject site. The following table lists addresses associated with the subject site buildings:

Address	Block	Number of Units	Building Type
1101-1111 E. 130th Pl	11	6	A-11-12
1113-1135 E. 130th Pl	11	12	CL-11-2
1137-1147 E. 130th Pl	11	6	A-11-1
1149-1171 E. 130th Pl	11	12	CR-11-1
13031-13053 S. Greenwood Ave	11	12	CR-11-2
13055-13077 S. Greenwood Ave	11	12	CL-11-3
1100-1106 E. 131st St	11	4	D-11
1108-1130 E. 131st St	11	12	CR-11-3
1132-1142 E. 131st St	11	6	B-11
1144-1166 E. 131st St	11	12	CL-11-1
13201-13223 S. Greenwood Ave	12	12	CR-12-2
13241-13263 S. Greenwood Ave	12	12	CL-12-1
1101-1107 E. 132nd St	12	4	D-12-1
1109-1131 E. 132nd St	12	12	CL-12-3
1133-1143 E. 132nd St	12	6	B-12
1145-1167 E. 132nd St	12	12	CR-12-3
1100-1106 E. 133rd St	12	4	D-12-2
1108-1130 E. 133rd St	12	12	CR-12-1
1132-1142 E. 133rd St	12	6	A-12
1144-1166 E. 133rd St	12	12	CL-12-2
13101-13107 S. Greenwood Ave	13	4	D-13-1
1101-1123 E. 131st St	13	12	CR-13-1
1125-1147 E. 131st St	13	12	CL-13-2
1100-1122 E. 132nd St	13	12	CL-13-1
1124-1134 E. 132nd St	13	6	B-13
1136-1158 E. 132nd St	13	12	CR-13-2

3.2 Site & Vicinity General Characteristics

The subject site is located in a residential zone in Chicago, Illinois. It is a portion of the Altgeld Gardens housing development owned and operated by the CHA. The subject site consists of three blocks of the development. The remainder of the Altgeld Gardens development includes an additional fourteen blocks of residences, a maintenance building, a Chicago Park District field house and park, school buildings, and day care centers. Two more blocks of CHA residential housing developments are located south of E. 133rd St. and are known as the Phillip Murray Homes.

The topography of the subject site and adjacent properties is relatively level, with no significant natural relief features. **Appendix B** depicts a detailed site plan and adjacent properties.

3.3 Current Use & Ownership

The subject site totals approximately 17.3 acres in area and currently consists of 26 vacant two-story multi-unit residential buildings, an electrical building, parking lots, sidewalks, and landscape areas. The property is owned by the CHA. Photographs of the subject site and adjacent properties are provided in **Appendix C**.

3.4 Site Infrastructure

The subject site consists of 26 two-story brick buildings with a crawl space under the ground floor of the majority of the buildings. Three buildings, one in each block, had a basement. An electrical building containing transformers and switchgears was present on Block 11.

The following companies supply or formerly supplied utilities to the subject site:

Utilities	
Natural Gas	Constellation Energy
Electricity	Integrys Energy
Storm & Sanitary Sewers	City of Chicago
Potable Water	City of Chicago

3.5 Current Uses of Adjacent Properties

Adjacent properties with contiguous property lines were visually inspected from vantage points available to the general public. The subject site is bordered by the following properties:

Adjacent Properties	
North	East 130th Place, beyond which is TCA Health Clinic and its associated parking lot.
East	East 130th Place, CHA land currently used for urban gardening, and East 133rd Street beyond which is CHA land and Beaubien Forest Preserve.
South	East 133rd Street, beyond which is undeveloped land and the Little Calumet River.
West	South Greenwood Avenue, beyond which are Blocks 9 and 10 of the CHA Altgeld Garden Housing Complex. On some maps, South Greenwood Avenue is depicted as Leanna Tucker Avenue.

4.0 User Provided Information

ASTM Standard E 1527-13 requires the user of a Phase I ESA to provide the environmental professional with any information that could be deemed useful in identifying RECs. The User of this Phase I ESA is the CHA. A User Questionnaire was completed by Mr. Michael R. Merchant, CEO of the CHA, and was returned to Carnow Conibear on June 16, 2014. The User Questionnaire and associated correspondence can be reviewed in **Appendix D**.

4.1 Title Records

A real title search including any deeds, easements, leases, restrictions, and covenants for a period of fifty years was not provided to Carnow Conibear. However, a title search is not required by ASTM if other historical sources of information provide the necessary information. Carnow Conibear believes that the data collected during the Phase I ESA provided sufficient information about the site which eliminates the need for a fifty year title search. The site buildings were constructed between 1942 and 1944. CHA has been the owner of the property since 1956.

4.2 Environmental Liens or Activity & Use Limitations

This investigation, including information obtained from the User Questionnaires completed by the CHA, has revealed no record of environmental liens or activity use limitations specific to the subject site.

4.3 Specialized Information

Mr. Merchant indicated that he has no specialized knowledge concerning the subject site.

4.4 Commonly Known or Reasonably Ascertainable Information

Mr. Merchant indicated that he is aware that the property was used as farmland before it was developed as residential property. Mr. Merchant also indicated that he was aware of the PCB spill and subsequent cleanup conducted at Altgeld Gardens.

4.5 Valuation Reduction for Environmental Issues

Mr. Merchant indicated that an evaluation of the purchase price of the subject site has not been made.

4.6 Owner, Property Manager, and/or Occupant Information

The CHA has indicated that the subject site is owned by the CHA and is currently vacant. The subject site property is managed by East Lake Management Group, Inc.

4.7 Reasons for Performing this Phase I ESA

The reason for performing the Phase I ESA is to fulfill a HUD loan requirement.

4.8 Previous Environmental Reports

CHA provided Carnow Conibear with electronic versions of approximately 44 reports, letters, and miscellaneous documents (including duplicates) concerning the Altgeld Gardens and Murray Homes housing developments. Many of the documents dealt with areas outside of the boundary of this Phase I. Brief summaries of the reports (including some text copied verbatim from the documents) that directly related to the subject site (Blocks 11, 12, and 13) are provided below. Selected pages have been extracted from the reports and included in **Appendix E-1**.

File Name:	1996 August Aerial Photo Analysis		
Document Title:	AERIAL PHOTOGRAPHIC ANALYSIS ALTGELD GARDENS	**Date:**	August 1996
Document Type:	Report	**Pages:**	21
Prepared By:	Lockheed Environmental Systems & Technologies Co.	**Prepared For:**	US EPA

Notes:
This report presents findings of an analysis of historical aerial photography spanning the period 1938 to 1976. The analysis was performed for the study area known as the Pullman Sewage Farm and the community of Altgeld Gardens in Chicago, Illinois. This analysis was requested by Region 5 to document the possible disposal of sewage sludge and landfilling operations that may have taken place before housing was built.

Findings from the analysis indicate that the results of filling activity were observed in 1959 and 1967 in the Pullman site, which is west of Altgeld Gardens across S. Lawrence Ave. The material used for filling could not be identified; it appeared to be light-toned, but it could not be determined what the nature of the material was or if any wastes were incorporated into this material. No evidence of the effluent ditch, referred to in the collateral information, was identified in the period of analysis.

File Name:	1996 November Aerial Photo Analysis		
Document Title:	AERIAL PHOTOGRAPHIC ANALYSIS ALTGELD GARDENS	**Date:**	November 1996
Document Type:	Report	**Pages:**	16
Prepared By:	Lockheed Environmental Systems & Technologies Co.	**Prepared For:**	US EPA

Notes:
This report is an addendum to TS-PIC 9605510. It presents the results of an aerial photographic analysis of the Altgeld Gardens extended study area located in Chicago, Illinois. The primary data used for this report are two selected dates of black-and-white photographs: November 14, 1938 and September 3, 1959. This analysis was requested to document the possible disposal of sewage sludge and landfilling operations that may have taken place before housing was built in

the Altgeld Gardens extended study area. Findings from the analysis indicate evidence of a possible drainageway in the Altgeld Gardens Housing Development Area in 1938. This possible drainage way cuts through Blocks 3, 4, 7, 9, 10, and 12.

File Name:	1997-8-6_USEPA Site Assessment		
Document Title:	SITE ASSESSMENT REPORT FOR THE ALTGELD GARDENS COMMUNITY	**Date:**	August 6, 1997
Document Type:	Report	**Pages:**	71
Prepared By:	US EPA	**Prepared For:**	---

Notes:
US EPA assessed the possible presence of soil contamination at the Altgeld Gardens Community (AGC). CHA was advised of proposed assessment work and participated in sampling. Nine standing water samples were collected from flooded areas. Fourteen surface soil samples and ten subsurface soil samples were collected.

The water samples, surface soil samples, and sub-surface samples were analyzed for acid base neutrals (ABN), pesticides/polychlorinated biphenyls (PCBs), volatile organic analytes (VOAs), metals, mercury, and cyanide. All samples were analyzed at the U.S. EPA Central Regional Laboratory (CRL), Chicago, Illinois. Analytical results indicate that slightly elevated levels of PAH compounds may be present in the surface soils within the AGC area.

Analyses of surface soils, sub-surface soils and standing water within the AGC indicate that although elevated levels of PAHs were identified in surface soils within Block 11, the levels do not exceed the recommended removal action level (RAL) for total PAHs established in the "Emergency Removal Guidelines." Information from this report is being reviewed by U.S. EPA for a health based risk assessment. There are no conditions present in the areas assessed at the AGC that may present an imminent and substantial threat to public health and welfare and the environment. There were no conditions observed at the AGC during the site assessment which warrant a removal action.

File Name:	USEPA 5-98 Fact Sheet		
Document Title:	US EPA FACT SHEET, Altgeld Murray Gardens	**Date:**	May 1998
Document Type:	Fact Sheet	**Pages:**	4
Prepared By:	US EPA	**Prepared For:**	---

Notes:
This fact sheet describes the usage and sampling history of the site. It states that PAH and pesticide contamination was identified in 1996 and 1997 sampling events, and states the following:

Using USEPA risk assessment methodology, the lifetime excess cancer risk for exposure to the highest concentration of PAHs ranged from 2 x 10 (2 out of 10,000 exposed individuals) to 3 x 10 (3 out of 1,000 exposed individuals). In interpreting these estimates, one should keep in mind these are risks that are likely to be very similar to those experienced in any other urban site. In addition, the sampling results, as well as aerial photos of the area, reveal no physical evidence that Altgeld Gardens was built on a landfill or evidence of industrial contamination in the surface soil.

At this time US EPA has determined that additional sampling in the Altgeld Gardens is not necessary because Altgeld Garden levels were similar to those identified in studies of other urban areas. However, US EPA is conducting a PAH and lead background study to verify PAH and lead background levels for the City of Chicago. Information gathered in this study will be used to help determine future cleanup action levels for urban sites in general.

File Name:	1998-8-27_USEPA_Ltr on PAHs Present at Altgeld		
Document Title:	Re: Altgeld Gardens Housing Complex	**Date:**	August 27, 1998
Document Type:	Letter	**Pages:**	2
Prepared By:	US EPA	**Prepared For:**	CHA

Notes:
USEPA collected samples in 1996 at the request of the community and found PAH contamination. USEPA found no evidence of a specific source and suspects that atmospheric deposition from point, area, and mobile sources were likely responsible. A comparison of PAH levels detected at Altgeld Gardens to those found in other urban areas indicated that the Altgeld values were within the expected range. USEPA strongly recommends that CHA reduce residents' contact with PAH contaminated soils, including establishing groundcover, placing wood chips, and planting grass. These activities will greatly reduce risk to children and adults by eliminating direct contact with contaminated soils. These measures may also result in the reduction of the PAH compounds through a natural process known as phyto-remediation.

Document Title:	Re: Altgeld Gardens Community	**Date:**	September 11, 2000
Document Type:	Letter	**Pages:**	3
Prepared By:	US EPA	**Prepared For:**	Hopkins & Sutter

Notes:
Information concerning the potential analytical problems involving the United States Environmental Protection Agency's (U.S. EPA) Central Regional Laboratory, and U.S. EPA's proposal to conduct core sampling for Polychlorinated Biphenyls (PCBs) in the yards on the north side of the Dorothy Gautreax Child Parent Center, 975 E. 132nd Street, Chicago, Illinois (Gautreax Center), and surface soil and surface water sampling in the area throughout the

community housing, as in the enclosed figure.

During the spring of 1996 the Chicago Housing Authority (CHA) conducted a cleanup of soil contaminated with PCBs, a chemical regulated under the Toxic Substances Control Act, from the yards on the north side of the Gautreax Center. The source of the PCB contamination was a storage lot located across the street from the Gautreax Center where the CHA had disposed PCBs from electrical transformers. During the cleanup, approximately one foot of soil was excavated across the entire north side of the Gautreax Center, cleanup confirmation samples were collected, and the area was backfilled with clean soil trucked in from off site. U.S. EPA, Region 5, conducted oversight of the CHA's cleanup and assisted the CHA by providing laboratory analysis of the CHA's samples. Based on the sample analysis, Region 5 determined that the PCB cleanup level of less than 10 parts per million (ppm) had been met, and the area could be backfilled to grade with clean soil.

During 1996 and 1997, U.S. EPA also conducted surface soil and water sampling in certain areas of the housing complex in response to residents' concerns with potential contamination. The surface soil samples and surface water samples were analyzed for a full range of contaminants. Low levels of polycyclic aromatic hydrocarbons (PAHs), mainly Benzo(a)pyrene and low levels of DDD, DDT and DDE, were found in the soil samples. Although results were below action levels, U.S. EPA recommended to the CHA that a grass cover be placed in areas where bare soil was present. This grass cover prevents direct contact with soil.

Since these actions, allegations of misconduct in the analysis of samples have been made. Because of these allegations, U.S. EPA has determined that data generated from samples analyzed by these individuals will not be relied on for its decisions. Even though U.S. EPA has reviewed the 1996 raw analytical data and cannot conclude that there was any failure to follow analytical procedures which caused the analytical results to be lower than target levels indicating a need for cleanup, U.S. EPA believes the most prudent course of action is to resample this area, U.S. EPA must emphasize that the north yards are covered by approximately one foot of clean soil and do not present a significant risk to children attending the Gautreax Center or to the nearby community. It should also be noted that no similar problems have been found with the cleanup at the Altgeld Gardens storage lot, which was completed last summer.

With regard to the Superfund sampling, all locations will need to be resampled by U.S. EPA. However, samples will only be analyzed for pesticides and volatile organic compounds. U.S. EPA intends to conduct this sampling by the middle of September.

File Name:	2000-11-15_E-E Rpt		
Document Title:	Letter Report for Altgeld Gardens	**Date:**	November 15, 2000
Document Type:	Report	**Pages:**	47
Prepared By:	Ecology & Environment, Inc.	**Prepared For:**	US EPA

Notes:
The purpose of the site assessment was to resample surface soil locations on the Altgeld

Gardens Community (AGC) that were originally sampled by U.S. EPA in 1996 and 1997 and analyzed for poly aromatic hydrocarbons (PAHs) and pesticides. Analytical results from that sampling effort are suspect because recent investigations have determined that certain analytical data, including pesticide analyses, generated by CRL at the time of the U.S. EPA Altgeld Gardens soil sampling event may be erroneous.

Various pesticides were detected in every soil sample. In general it appears, from a comparison of the data, that the U.S. EPA sample results were higher than those of the START samples, although not in all cases.

This report is discussed in greater detail later in this section of the Phase I ESA report.

File Name:	2001-2-16_Dept of Health and Human Serv_Altgeld Health Consultation		
Document Title:	Health Consultation, October 2000 Soil Sampling, Altgeld Gardens	**Date:**	February 16, 2001
Document Type:	Report	**Pages:**	12
Prepared By:	US Dept. of Health and Human Services/Illinois Department of Public Health	**Prepared For:**	US EPA

Notes:

US EPA requested IDPH to evaluate public health hazards from soil at Atlgeld Gardens.
From the summary: US EPA conducted site investigation at Altgeld Gardens in 1996. In 1998, IDPH evaluated the data and concluded that no apparent public health hazard existed from exposure to the surface soil contamination detected. IDPH recommended additional surface soil samples near the sample with the greatest pesticide levels. In 1999, US EPA collected 12 soil samples along 134th street on the southern edge of Altgeld Gardens. IDPH concluded that no apparent public health hazard existed from exposure to the pesticide residuals detected in the surface soils.

In 2000, 10 surface soil samples were collected from the top 2 to 3 inches of soil and analyzed for pesticides. DDT, DDE, and heptachlor epoxide were detected, but IDPH concludes that no apparent public health hazard exists from exposure to the pesticide residuals detected in surface soil.

This report is discussed in greater detail later in this section of the Phase I ESA report

Document Title:	Summary Report, Altgeld Gardens Renovation, Blocks 11, 12, and 13	**Date:**	July 1, 2009
Document Type:	Report	**Pages:**	209
Prepared By:	GSG Consultants, Inc.	**Prepared For:**	CHA

Notes:
Report summarizes the findings of field sampling activities within landscaped areas of Blocks 11, 12, and 13. GSG performed 122 soil borings to maximum depth of 2 feet. Samples analyzed for Polynuclear Aromatics Hydrocarbons (PAH), and total lead and arsenic. A total of 24 of the 122 sample locations reported values that exceed PNAs and arsenic Tier 1 Soil Remediation Objectives (SROs) for residential properties or Metropolitan Area background concentrations. None of the collected soil samples exhibit lead values above Tier 1 SROs for residential properties.

This report is discussed in greater detail later in this section of the Phase I ESA report

Document Type:	Report	**Pages:**	456
Prepared By:	GSG Consultants, Inc.	**Prepared For:**	Holabird & Root LLC

Notes:
Hazardous materials building survey of the units associated with the Altgeld Gardens Blocks 11, 12 & 13. The survey included twenty-six (26) residential buildings with a total of 244 individual units to identify the location and quantity of asbestos containing material (ACM), lead-based paint (LBP), mold, poly-chlorinated biphenyls (PCB), and Universal Waste.

GSG identified ACM, LBP, and suspect mold in the buildings. GSG did not observe any fluorescent light fixtures, PCB ballasts, or chemical waste on site during the survey.

The following potential contamination issues were identified in the review of the documents provided by CHA:

November 15, 2000, Letter Report for Altgeld Gardens, and February 16, 2001, Health Consultation

The November 15, 2000, Letter Report prepared by Ecology and Environment, Inc. (E&E) for the US EPA presents the results of pesticide sampling and resampling conducted throughout the Altgeld Gardens and Murray Homes developments. In 1996, three of the samples were collected from the subject site: S15 (Block 11), S16 (Block 12), and S20 (Block 13). In 2000, these areas were resampled and given the following sample names: AGS10 (Block 11), AGS8 (Block 12), and AGS9 (Block 13). All of the soil samples were grab samples collected from two to three inches below the grass surface.

Pesticides were detected in each of the samples. Carnow Conibear evaluated the soil analysis data in relation to the SROs promulgated in 35 IAC 742, also known as *Tiered Approach to Corrective Action Objectives* (TACO). The soil samples from Block 12 (S16/AGS8) contained concentrations of two pesticides that were slightly above the SRO for Residential Ingestion. The DDE concentration detected was 2.399 mg/kg, which is slightly above the SRO of 2.0 mg/kg, and the Heptachlor epoxide concentration detected was 0.0974 mg/kg, which is slightly above the SRO of 0.07 mg/kg.

There is no obvious, discrete source for the pesticide concentrations detected in the samples. Based on the dispersed nature of the identified compounds, there is no clear point source or “hot spot” of contamination.

The Illinois Department of Public Health reviewed the sampling data and prepared the February 16, 2001 Health Consultation letter. The IDPH concluded that no apparent public health hazard exists from exposure to the pesticide residuals detected in surface soil.

Therefore, the concentrations of pesticides detected in the 1996 and 2000 sampling events in Blocks 11, 12, and 13 can be considered a de minimis condition to the subject site as defined in Section 3.2.22 of ASTM E1527-13. If soil is excavated from the areas where concentrations exceeded SROs, the soil should be handled and/or disposed of properly.

July 1, 2009, Summary Report

The July 1, 2009, *Summary Report, Altgeld Gardens Renovation, Blocks 11, 12, and 13*, prepared by GSG Consultants, Inc. (GSG) for the CHA, was labeled “DRAFT Work In Progress”. The report documents soil sampling performed by GSG within Blocks 11, 12, and 13. One hundred and twenty-two (122) soil borings were installed throughout the blocks. Soil samples were collected for analysis from depth intervals of approximately 6 inches to 1 foot and from 1 foot to 2 feet below existing landscaped surfaces. Soil samples were analyzed for Polynuclear Aromatic Hydrocarbons (PNAs), total lead and total arsenic. GSG reported that 24 of the 122 sample locations reported values that exceeded the Tier 1 Soil Remediation Objectives (SROs) promulgated in 35 IAC 742 TACO for PNAs and/or arsenic. No SRO exceedances for lead were reported. GSG recommended that soil exceeding Tier 1 SROs should not be used as backfill during site renovation activities and that it be disposed of at a licensed Subtitle D landfill if it is removed from the site. GSG estimated the volume of soil exceeding Tier 1 SROs to be 2,497 cubic yards.

Carnow Conibear evaluated the soil analysis data in relation to the SROs promulgated in 35 IAC 742 TACO. Arsenic and five PNAs were identified in exceedance of the applicable Tier 1 SROs for the residential ingestion exposure route. Based on the dispersed nature of the identified exceedances, there is no clear point source or “hot spot” of contamination.

Carnow Conibear performed a 95% Upper Confidence Limit (UCL) evaluation of the data pursuant to 35 IAC 742.225(d) and (e). The objective of this evaluation was to determine whether the resulting 95% UCL concentration of each analyte, as derived from the data/results (sample population), is less than the corresponding applicable Tier 1 residential ingestion SRO, as adjusted for background concentrations in the City of Chicago for PNAs and counties within Metropolitan Statistical Areas (MSAs) for arsenic. Carnow Conibear utilized the Statistical Software *ProUCL 4.1 for Environmental Applications* to calculate the 95% UCL for the five PNA compounds and arsenic. These data sets incorporated appropriate methods to address “No-Detects.” The resulting concentrations are presented in the following table:

Analyte	95% UCL (mg/kg) All Data	Applicable Tier 1 SRO (mg/kg)	Exceedance?
Arsenic	10.51	13.0	No
Benzo(a)anthracene	0.961	1.1*	No
Benzo(a)pyrene	0.544	1.3*	No
Benzo(b)fluoranthene	0.698	0.9	No
Dibenzo(a,h)anthracene	0.114	0.2*	No
Indeno(1,2,3-c,d)pyrene	0.199	0.9	No

* Indicates median background concentration applied as Tier 1 SRO.

The results of this analysis indicate that each 95% UCL concentration is below the corresponding applicable Tier 1 residential ingestion SRO (or median background concentration) for each respective analyte. Therefore, the concentrations of PNAs and arsenic detected in the July 2009 GSG sampling event can be considered a de minimis condition to the subject site, because the concentrations do not generally present a threat to human health or the environment and generally would not be the subject of an enforcement action if brought to the attention of the appropriate governmental agencies, as defined in Section 3.2.22 of ASTM E1527-13. If soil is excavated from the areas where concentrations exceeded SROs, the soil should be handled and/or disposed of properly.

The 95% Upper Confidence Level ProUCL analysis is presented in **Appendix E-2**.

5.0 Records Review

5.1 Standard Environmental Record Sources

This section presents the results of the state and federal government agency Freedom of Information Act (FOIA) responses and the government agency database search that was performed by Environmental Data Resources, Inc. (EDR) in accordance with the ASTM standard.

5.1.1 Federal & State Regulatory Agencies

Carnow Conibear submitted FOIA requests and reviewed public online databases of state and federal agencies in an effort to obtain information regarding the subject site and adjacent properties. Documentation of the FOIA correspondence and database search results can be found in **Appendix F-1**. The following agencies were contacted:

- United States Environmental Protection Agency (USEPA)

  Carnow Conibear searched the USEPA's EnviroFacts online database. Altgeld Gardens, which includes the subject site, was listed on the database under Agency Compliance and Enforcement Systems (ACES) as an operator of apartment buildings. The subject site was not flagged for Significant Non-compliance (SNC) or High Priority Violations (HPV).

- Illinois Environmental Protection Agency (IEPA)
  Springfield, Illinois

  Carnow Conibear submitted a FOIA request to the IEPA on May 13, 2014 regarding any information of environmental concern for the subject site. A response was received from the IEPA on June 4, 2014 indicating that they had no records on file for the subject site addresses.

- Illinois Emergency Management Agency (IEMA)
  Springfield, Illinois

  Carnow Conibear's search of the IEMA's online Hazardous Materials Incident Reports database did not reveal any record of incidents on the subject site or immediately adjacent properties.

- Illinois Office of the State Fire Marshal (OSFM)
  Springfield, Illinois

  Carnow Conibear searched the OSFM's State of Illinois UST online database for addresses on E. 130th Place, Greenwood Avenue, E. 131st Street, E. 132nd Street, and E. 133rd Street in Chicago, Illinois. The subject site and immediately adjacent properties were not listed in the OSFM database.

5.1.2 Regulatory Database Inquiry

Carnow Conibear retained EDR to conduct a search of available environmental databases for the subject site and surrounding properties. The databases were searched according to ASTM standards, with supplemental environmental information also provided. The descriptions, sources, telephone numbers, and government version dates for each of the databases are provided in **Appendix F-2**. Carnow Conibear used the subject site to specify the site location as the "target property." The following table lists the databases searched by EDR and the corresponding ASTM search distances.

Database	ASTM Search Distance
National Priority List (NPL) The federal National Priority List is a federal list of abandoned or uncontrolled hazardous waste sites identified for priority remedial action under the Superfund program.	1.0 Mile
Delisted National Priority List (D-NPL) The National Oil and Hazardous Substances Pollution Control Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.	0.5 Mile
Comprehensive Environmental Response & Liability Information System (CERCLIS) The federally maintained Comprehensive Environmental Response, Compensation and Liability Information System is a compilation of past and current sites that the EPA has investigated pursuant to the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA). It also includes abandoned or uncontrolled waste sites identified under the federal Superfund Program.	0.5 Mile
CERCLIS No Further Remedial Action Planned (NFRAP) Sites which have been investigated and subsequently delisted from the federal CERCLIS are designated as No Further Remedial Action Planned (NFRAP) sites.	0.5 Mile
Resource Conservation Recovery Act (RCRA) Information RCRA Information is EPA's comprehensive information system, including information on selective information on sites which treat, store or dispose (TSD) hazardous wastes. CORRACTS identifies hazardous waste handlers with RCRA corrective action activity. Conditionally exempt small quantity generators (CESQGs) generate less than 100 kilograms (kg) of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs) generate over 1,000 kg of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDs treat, store or dispose of waste.	Subject Site or Adjacent Property * 0.5 Mile if TSD

Database	ASTM Search Distance
Federal/State Engineering/Institutional Controls Registries These federal and state registries list sites with engineering or institutional controls associated with them. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are often required as a part of institutional controls.	Subject Site
Emergency Response Notification System (ERNS) Emergency Response Notification System, maintained by the federal government, records and stores information on reported releases of oil and hazardous substances.	Subject Site
Category List (CAT) Illinois EPA information listing notice of response action, NPL, pre/proposed NPL, completed remedial action, SRP, federal facilities, and cleanup started and or cleanup completed sites.	1.0 Mile
State Hazardous Waste Sites (SHWS) State hazardous waste sites records are the state's equivalent to the federal CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for clean-up using state funds are identifiable along with sites where cleanup will be paid by potentially responsible parties.	0.5 Mile
Solid Waste Facilities / Landfill Sites (SWF/LF) Solid Waste Facilities / Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. These may be active or inactive facilities, or open dumps that failed to meet RCRA subtitle D Section 4004 criteria for solid waste landfills or disposal sites.	0.5 Mile
Underground Storage Tank (UST) A database of registered USTs that are regulated under Subtitle I of RCRA and must be registered with the state department responsible for administering the UST program. In Illinois the UST registry is maintained by the Office of the State Fire Marshall.	Subject Site or Adjacent Property
Leaking Underground Storage Tank (LUST) The Leaking Underground Storage Tank records contain an inventory of LUST incidents reported to the state.	0.5 Mile
Site Remediation Program (SRP) The Illinois Site Remediation Program (SRP) database includes properties that are enrolled in the state's voluntary clean-up program.	0.5 Mile
Brownfields Brownfields are abandoned or underused industrial and/or commercial properties that are contaminated (or thought to be contaminated) and have an active potential for redevelopment. The Illinois Municipal Brownfields Redevelopment Grant Program offers grants to assist in site investigation activities, development cleanup objectives, and performance of cleanup activities.	0.5 Mile

Note: The report also includes additional databases that are not required to be searched by ASTM standards. These additional database results are reviewed for potential environmental impact on the subject site.

The subject site addresses were not identified in the databases accessed by EDR. However, the Altgeld Gardens complex was identified under FINDS, IL AIRS, IL SPILLS, and IL BOL. Further review found that the IL SPILLS and IL BOL listings are associated with the property at 940 E. 132nd Street. Federal listings identified in the EDR report within the ASTM minimum search distances from the subject site include: One CERCLIS listing, one CERCLIS NFRAP listing, two CORRACTS listings, four RCRA-SQG listings, and two RCRA-CESQG listings. State and local listings identified in the EDR report within the ASTM minimum search distances from the site include: five IL NIPC listings, four UST listings, and one RCRA-NonGen listing. EDR Proprietary Records listings identified in the EDR report within the ASTM minimum search distances from the subject site include: five EDR Historical Cleaners listings.

Due to the densely urbanized area in which the subject site is located, EDR identified many listings within the ASTM search distances. Carnow Conibear evaluated the listings to determine which sites might pose a potential environmental threat based on the presence of intervening properties and thoroughfares which would impede impacts to the subject site. The following table summarizes sites that could possibly affect the environmental conditions at the subject site. The complete EDR report is presented in **Appendix F-2**.

Distance from Site	Owner/Address	Listed Database	Comments
Subject Site Elevation 589 ft.	CHA-Altgeld Gardens Various Chicago, Illinois 60827	FINDS IL AIRS	Registry ID: 110018484146 Facility ID: 3256 ID Number: 031600DIA SIC Code: 6513 Site ID: 170000048856 Inv Number: 0316545003

NOTE: Carnow Conibear has interpreted the EDR Report to eliminate duplicate addresses and misspellings reported to the governmental agencies.

Review of the EDR environmental database listings is summarized below:

- Altgeld Gardens, including the subject site, was identified previously in the USEPA EnviroFacts database and is listed under FINDS and IL AIRS. FINDS is a comprehensive database that lists facilities regulated under a variety of EPA programs. AIRS provides information regarding air permitting and emissions. Based on the lack of reported violation, this listing should not pose a significant threat to the subject site at this time.

- City of Chicago, located at 1100 E. 130th Place, is listed as a RCRA small quantity generator with no violations. Based on the lack of reported violation, this listing should not pose a significant threat to the subject site at this time.

- Altgeld Gardens, located at 977 E. 132nd Street, is listed as a RCRA conditionally exempt small quantity generator with no violations. Based on the lack of reported violation, this listing should not pose a significant threat to the subject site at this time.

- Norfleet Cleaners, located at 13114 S. Ellis Avenue, is listed as a historical cleaners approximately 649 feet west of the subject site. No additional environmental records or citations were found for this site. Based on the lack of reported violation, this site should not pose a significant threat to the subject site at this time.

- Chicago Housing Authority/Altgeld Gardens (Murray Homes), located at 940 E. 132nd Street, is listed as under HMIRS for a gasoline spill which occurred in 2004 during delivery of the fuel to the site. Approximately five gallons of gasoline was spilled and cleaned up by the Chicago Fire Department.

  The site was listed in the Integrated Compliance Information System (ICIS) and appears to have received several penalties under Toxic Substance Control Act (TSCA) 16 Enforcement Action. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list.

The Chicago Housing Authority site (maintenance building) is listed as a RCRA Non-Generator with no violations. The site is listed as having one LUST/SPILLS incident (20070682) and one 1,000 gallon gasoline UST. Online review of the OSFM website indicates that the UST was removed on May 21, 2007. A NFA/NFR Letter was issued for LUST incident 20070682 on September 10, 2007.

The site was listed in the FIFRA/TSCA Tracking System (FTTS) for inspections and violations for the disposal of PCBs. Reports provided by CHA indicate that PCB contamination has been remediated to acceptable levels on the property and are no longer a concern.

The maintenance building property was enrolled into the Site Remediation Program (SRP) on November 23, 2011 and issued LPC# 31654003. An NFA/NFR letter has not been issued for the site. Reports provided by CHA indicate that a Comprehensive Site Investigation/ Remediation Objectives Report/Remedial Action Plan (CSI/ROR/RAP), dated November 18, 2011, was submitted to the IEPA for approval. Contaminants identified at the site include PNAs, mercury, lead, arsenic, and manganese. After additional soil sampling requested by the IEPA in a CSI/ROR/RAP Comments letter dated January 19, 2012 was submitted, the IEPA approved the Response to CSI/ROR/RAP Comments letter. The January 19, 2012, sampling report demonstrated that the contaminants at the site were not a threat to Class I Groundwater.

Based on the current SRP status, the nature of the contaminants, and the distance from the subject site (over 700 feet) this site does not represent a REC to the subject site.

Carver Park Natatorium, located at 939 E. 132nd Street, is listed as a RCRA conditionally exempt small quantity generator with no violations. The site is listed as having one 5,000-gallon heating oil UST. The UST is listed as having been abandoned in place. These listings do not represent RECs to the subject site.

- Calumet NU Earth, located at 130th Street and Doty Avenue, is listed as an IL NIPC site. Review of the NIPC Historical Inventory of Solid Waste Disposal Sites in Northeast Illinois indicates that the site is located in Section 26, Township 37N, Range 14E. Online review of the IEPA Bureau of Land databases indicates that the site has IEPA number 0316490016. Based on the lack of reported violation, this listing should not pose a significant threat to the subject site at this time.

- Land & Lakes Transfer Station is listed as a RCRA small quantity generator with no violations. Online review of the USEPA Envirofacts database found that the site is located on across the Little Calumet River on 138th Street and not adjacent to the subject site. Based on the distance to the subject site, this listing should not pose a significant threat to the subject site at this time.

5.1.3 EDR Orphan Sites

There were twenty orphan sites (listed sites that could not be mapped due to poor or inadequate address information) identified during the database search. Upon further investigation, no evidence was found to suggest that these sites would pose an environmental threat to the subject site. The complete orphan site list is included in **Appendix F-2**.

5.2 Additional Environmental Record Sources

5.2.1 Local Government Agencies

Carnow Conibear submitted FOIA requests to local agencies in an effort to obtain information regarding the subject site. Copies of the state and local requests and responses can be found in **Appendix F-1**. The following agencies were contacted:

- City of Chicago Fire Department (CFD), Chicago, IL

  Carnow Conibear received a response from the CFD on May 21, 2014 indicating that they have no records concerning for the subject site.

- Chicago Department of Public Health (CDPH), Chicago, IL

  Online review of CDPH Environmental Records Lookup Table found records concerning the subject site consisting of asbestos abatement work, permits for surface cleaning/grinding and the installation of combustion emission unit, and a complaint and inspection concerning a diesel fuel spill from a leaking generator. CDPH records indicate that the spill was remediated and no notice of violation was issued.

- Chicago Department of Fleet and Facilities Management (2FM), Chicago, IL

  Carnow Conibear received a response from 2FM on June 2, 2014 indicating that they have records concerning the Altgeld Gardens Housing Project. The records consisted of 1) a CDPH report regarding residential soil sample results taken from Block 17 of Altgeld Gardens; 2) PCB wipe sampling results for samples collected from the Gautreax Child/Parent Center, Garden Fast Food, and Altgeld Branch Library; and 3) Phase I and II ESA's for the Chicago Youth Gautreax Center. The reports indicated that the results soil and wipe samples collected were below their respective remediation objectives, with the exception of two polycyclic aromatic hydrocarbons (PAHs) found in a soil sample collected in a courtyard in Block 17. Carnow Conibear compared the PAH results to current IEPA Tiered Approach to Corrective Action (TACO) Tier 1 Soil Remediation Objectives (SROs) and found that only benzo(a)pyrene exceeded the SROs. The CDPH report indicated that the result may be indicative of a single isolated incident at the site and determined that there were no apparent health concerns related to normal exposure to soil at this property. The CDPH recommended the maintenance of a vegetative cover on the soil to reduce exposure. Based on the analytical results and distance to the subject site, these properties do not pose a significant threat to the subject site at this time.

5.3 Physical Setting Sources

5.3.1 Surface Water Characteristics

The topography of the subject site and adjacent properties is relatively level, with no significant natural relief features. According to the USGS 7.5-minute topographic quadrangle for Lake Calumet, Illinois (dated 1997) accessed by EDR, the elevation in the vicinity of the subject site is approximately 589 feet above mean sea level.

The Federal Emergency Management Agency (FEMA) lists the subject site in an area determined to be outside the 0.2% annual chance floodplain. [National Flood Insurance Program, Map numbers 17031C0661J, 17031C0662J, 17031C0663J, and 17031C0664J, August 19, 2008]

According to the map provided by EDR, there are no wetlands on the subject site. No standing bodies of water or wetland vegetation was observed during the recent site inspection.

5.3.2 Subsurface Geological Characteristics

Surficial geology at the site is mapped in the Wadsworth Formation of the Wedron Group. This unit is a succession of calcareous gray, fine-textured till consisting mainly of clay, silt, and fine sand. Although most of the till beds in this formation appear relatively homogeneous and massive, some contain silt laminae and sand lenses. Dominant pebble rock types are dolomite and shale (Hansel & Johnson, 1996, and Stiff, 2000).

Carnow Conibear reviewed Plate 1 of the ISGS Circular, *Potential for Contamination of Shallow Aquifers in Illinoi*s, indicating that the regional geologic materials underlying the subject site are designated as “B1” and “E”. The “B1” classification denotes the presence of sand and gravel at the surface in layers less than 20 feet thick, which are underlain by till or impermeable bedrock. Although the sand and gravel may be used for local well points, these deposits generally do not yield large quantities of water. The potential for contamination of surface water and groundwater in B1 areas is high. A hydraulic conductivity of about 1×10^{-3} cm/sec (high) makes these materials an excellent medium for transport of contaminants. Because water may flow along contacts between materials with different textures (e.g. through sand and gravel over dense bedrock) and discharge on slopes, there is also a potential for ground-to-surface water contamination in B1 areas. The “E” classification denotes deposits of uniform, relatively impermeable silty or clayey till or other fine-grained materials that are more than 50 feet thick, with no identified sand and gravel layers. The potential for contamination in E areas is low because of low hydraulic conductivity in the till, 1×10^{-9} to 1×10^{-7} cm/sec, and good attenuation capacities of the materials. (Berg, et al. 1984)

Per Plate 2 of the Berg Circular, the subject site is located in area designated as “C1” and “D2”. C1 areas are described as sand and gravel at the surface, less than 20 feet thick; underlain by till or impermeable bedrock. D2 areas are described as uniform, relatively impermeable silty or clayey till or other fine-grained materials extending from the surface to more than 20 feet deep; no interbedded sand and gravel.

5.3.3 Groundwater Characteristics

The EDR database identified several historic wells in the general vicinity of the subject site. No wells were identified on the subject site, and information regarding other wells in the area did not provide enough information regarding the direction of groundwater flow. Information from the well searches performed by EDR can be viewed in **Appendix F-2**.

Carnow Conibear searched the IEPA Bureau of Land (BOL) online database for groundwater ordinances in the City of Chicago. An ordinance was enacted in May of 1997 restricting the installation and use of potable water wells within the City limits. This ordinance is accepted by the IEPA as an environmental institutional control pursuant to Title 35 Illinois Administrative Code Part 742 (35 IAC 742).

Two (2) primary aquifers are present in the Chicago metropolitan region. These aquifers are the shallow dolomite aquifer (which includes the bedrock strata directly underlying the unconsolidated glacial sediments) and the deep Cambrian-Ordovician Aquifer (which predominately consists of sandstone) and is isolated from the shallow dolomite aquifer by up to 250 feet of shale. Discontinuous glacial aquifers are also present in the Chicago region in the form of lacustrine sands (Dolton Member of the Equality Formation) and outwash sand and gravel of the Henry and Wedron Formations (Willman, 1971).

5.4 Historical Use Information

5.4.1 Historical Aerial Photographs

Historical aerial photographs for the subject site and surrounding areas were reviewed for the years 1938, 1952, 1962, 1964, 1974, 1988, 1993, 1998, 2005, 2007, 2009, 2010, 2011, and 2012. Carnow Conibear reviewed the photographs in an effort to determine former site usage and identify potential environmental concerns. The Aerial Photo Decade Package provided by EDR can be viewed in **Appendix G-1**.

Review of the historical aerial indicated that the subject site was agricultural land in 1938. By 1952, residential Blocks 1 through 13 and other assorted buildings pertaining to Altgeld Gardens had been developed. Vacant land is depicted to the north, beyond which is E. 130th Street; vacant land and Beaubien Forest Preserve to the east, beyond which are railroad tracks; vacant land to the south, beyond which is the Little Calumet River; and residential Blocks 9 and 10 of Altgeld Gardens to the west. The 1962 photograph depicts the development of residential Block 15 of Altgeld Gardens immediately southwest of the subject site. Two roads have been added north of the subject site and the church building has been developed west of Block 11. There are no significant changes until 1975 when a road is depicted east of Blocks 11 and 13 of the subject site and E. 132nd Street has been extended further east. The 1998 photograph depicts the development of the clinic building and associated parking lot on the north adjacent property. By 2007, the electrical building had been developed on the east central portion of Block 11 of the subject site. There were no other significant changes to the subsequent aerial photographs.

5.4.2 Sanborn Fire Insurance Maps

Carnow Conibear retained EDR to provide Sanborn Fire insurance Maps for the subject site and surrounding area. The EDR Sanborn Library includes more than 1.2 million Sanborn maps from the Library of Congress, University Publications of America, and a private collection. Sanborn Map coverage was available for review for the years 1975, 1987, 1989, 1992, 2002, and 2004. The Sanborn Report supplied by EDR can be viewed in **Appendix G-2**.

Sanborn Map Date	Subject Site Usage	Adjacent Property Usage
1975	The subject site consists of 26 two-story residential building and parking lots.	• North adjacent property – E. 130th Place, beyond which is vacant land. • East adjacent properties – Vacant land and Beaubien Forest Preserve, beyond which are railroad tracks. • South adjacent property – E. 133rd Street ,

Sanborn Map Date	Subject Site Usage	Adjacent Property Usage
		beyond which is a playground. - West adjacent properties – S. Greenwood Avenue, beyond which are several residential buildings associated with Altgeld Gardens Apartments and the United Church.
1987	The 1987 Sanborn map reveals no significant changes to the subject site as compared to the 1975 map.	- North adjacent property – No significant changes. - East adjacent properties – No significant changes. - South adjacent property – No significant changes. - West adjacent properties – No significant changes.
1989	The 1989 Sanborn map reveals no significant changes to the subject site as compared to the 1987 map.	- North adjacent property – No significant changes. - East adjacent properties – No significant changes. - South adjacent properties – No significant changes. - West adjacent properties – No significant changes.
1992	The subject site is not depicted on the 1992 map.	- North adjacent property – No significant changes. - East adjacent properties – No significant changes. - South adjacent properties – No significant changes. - West adjacent properties – No significant changes.
2002	The 2002 Sanborn map reveals no significant changes to the subject site as compared to the 1989 map.	- North adjacent property – A public building has been developed beyond E. 130th Place. - East adjacent properties – No significant changes. - South adjacent properties – No significant changes. - West adjacent properties – No significant changes.
2004	The 2004 Sanborn map reveals no significant changes to the subject site as compared to the 2002 map.	- North adjacent property – No significant changes. - East adjacent properties – No significant changes. - South adjacent property – No significant changes - West adjacent properties – No significant changes.

Review of the Sanborn maps indicates that the subject site has been utilized for residential purposes since at least 1975.

6.0 Site Reconnaissance

6.1 Methodology & Limiting Conditions

A visual inspection of the subject site was conducted on May 28, 2014 by Ms. Nohemi Melero and Mr. Paul Waite P. E. of Carnow Conibear and Mr. John Fenn of JHF Consulting, Inc. Mr. Lloyd Sims, Assistant Head General at East Lake Management Group, Inc., provided access to the subject site buildings during the inspection. Conditions during the visit were favorable with dry sunny weather. Photographs taken at the subject site can be viewed in **Appendix C**.

6.2 General Site Setting

The subject site is located in a residential area of Chicago, Illinois. **Appendix B** depicts the Site Plan and adjacent properties.

6.3 Exterior Observations

The subject site consists of 26 two-story brick buildings, an electrical building, parking lots, sidewalks, and landscape areas. Each residential building had a mechanical room at one end with boilers, a water tank, and a water heater.

Four of the residential buildings on the subject site had former incinerators attached to the end of the building. According to Mr. Lloyd Sims, Assistant Head General with Eastlake Management Group, the incinerators were used to burn garbage from the 1940's until their use was terminated in the 1970's, when garbage burning was banned. The burning of garbage in the incinerators over that period could contribute contamination from ash, spills, or leaching to the immediate vicinity, and therefore the incinerators are considered a REC to the subject site.

Exterior Site Observations	
Lot Size	~ 17.3 acres
Shape of Parcel(s)	Irregular
Buildings on Site	Twenty six residential buildings, one electrical building.
Exterior Improvements	No
Pools of Liquid	Yes, basements and crawl spaces were flooded. A water line break in unit 1110 E. 131st St. flooded the landscape area in front of the unit.
Drums, Hazardous Material or Petroleum/Unidentified Substance Containers	No
Stained Soil or Pavement	Block 11 – Stained transformer concrete pad
Stressed Vegetation	No
Wells	No
Solid Waste or Fill Material	No
Pits, Ponds, Lagoons, Surface Water, Waste Water	No
Septic Systems	No
Railroad Tracks	No

Exterior Site Observations	
Pipeline(s)	No
Incinerators	4 Incinerators: Block 11 – 1113-1135 E. 130th Pl. - Removed Block 11 – 1108-1130 E. 130th St. Block 12 – 1109-1131 E. 132nd St. Block 13 – 1101-1123 E. 131st St.

6.4 Interior Observations

The subject site buildings consist of a twenty six two-story multi-residential brick buildings which are currently vacant. Carnow Conibear inspected one residential unit from each of the subject site multi-unit buildings, with the exception of building 1133-1143 E. 132nd St., which had a prototype unit consisting of three regular units. The ground floors consist of living rooms and kitchen areas. The second floors consist of bedrooms, restrooms, and closets. Peeling paint was observed in the majority of the units inspected. There are crawl spaces under the ground level flooring in all of the residential buildings, except the three buildings which have basements. Heating was provided by steam radiators heated by natural gas boilers located in the building with basements. The electrical building housed transformers and switchgears.

Site Observations

Pools of Liquid	None
Drums, Hazardous Material or Petroleum/Unidentified Substance Containers	None
Building Heating Type	Natural gas, Boiler/Radiators
Building Cooling Type	None
Pits, Waste Water	None
Sumps	Yes, 2 sumps in each building with a basement.

6.5 Hazardous Substances and/or Chemical Storage

On May 19, 1980, the U.S. Environmental Protection Agency (EPA) published, in the Federal Register, the first phase of the Resource Conservation and Recovery Act (RCRA), 1980 RCRA Laws. RCRA defines a hazardous waste as a solid waste that may cause or significantly contribute to serious illness or death, or that poses a substantial threat to human health or the environment when improperly managed.

The storage of hazardous substances or chemicals was not observed on the subject site at the time of the site inspection.

6.6 Above Ground & Underground Storage Tanks & Pipelines

6.6.1 On-Site

No evidence of the presence of UST, ASTs, or pipelines was observed on the subject site.

6.6.2 Adjacent Properties

No evidence of the presence of UST, ASTs, or pipelines was observed on the immediately adjacent portions of the bordering properties from publicly accessible vantage points.

6.7 Suspected Polychlorinated Biphenyls (PCB)-Containing Equipment

The Toxic Substance Control Act (TSCA) of 1976 mandates the regulation of toxic substances known as polychlorinated biphenyls (PCBs), a chemical component of many dielectric fluids, heat transfer fluids, hydraulic fluids, and lubricating oils. Equipment that may potentially contain PCBs includes electrical equipment such as transformers or capacitors, or hydraulically operated equipment, such as elevators, compaction equipment, or manufacturing equipment. Regulations promulgated under TSCA require that transformers containing PCBs be marked as such. A PCB Ban Rule was enacted in 1979 to eliminate the use of PCBs altogether. The owner of the transformer or other PCB-containing equipment is responsible for equipment maintenance and remediation in the event of a leak or release.

Three pad-mounted transformers were observed on the subject site during the site visit. The transformer in Block 11 had visible signs of staining on the concrete pad. The transformers in Blocks 12 and 13 appeared to be in good condition with no visible signs of leakage. According to Mr. Lloyd Sims with Eastlake Management, the CHA had replaced PCB-containing transformers in Altgeld Gardens between 2001 and 2003. If the transformer in Block 11 is removed, best management practices should be followed to make sure that the stained concrete pad is not contaminated before it is removed.

7.0 Interviews

7.1 Interview with Site Owner/Manager

Mr. Lloyd Sims, Assistant Head General with Eastlake Management Group, was interviewed on May 28, 2014 during the site inspection. Mr. Sims indicated that he did not know of any USTs, ASTs, environmental liens associated with the subject site. Mr. Sims indicated that improvements were made to the subject site units as the units became vacated by residents. There is no hydraulic equipment on the subject site. There are no thermostats in the residential units. Heat was regulated from the basement. According to Mr. Sims, there is one transformer in each Block. The PCB-containing transformers were removed between 2001 and 2003.

Mr. Sims stated that the incinerators located on the subject site were used to burn garbage and that their use was terminated in the 1970's when garbage burning was banned. The burning of garbage in the incinerators over that period could contribute contamination from ash, spills, or leaching to the immediate vicinity, and therefore the incinerators are considered a REC to the subject site.

7.2 Interviews with Occupants

The subject site buildings are currently vacant.

7.3 Interview with Phase I ESA User

A User Questionnaire was completed by Mr. Michael R. Merchant, CEO of the CHA. Information obtained from the User Questionnaire is summarized in **Section 4.0**. The User Questionnaire can be reviewed in **Appendix D**.

8.0 Findings & Opinions

Based on the findings of this Phase I Environmental Site Assessment, within the scope of this investigation and pursuant to the requirements of ASTM Standard Practice E 1527-13, the following findings are presented below:

8.1 General Findings

- The subject site is located in a residential area of Chicago, Illinois.
- According to historical sources accessed during this assessment, the subject site was agricultural land in 1938. By 1945, the subject site was developed with 26 residential buildings, sidewalks, and landscape areas. The electrical building was added to Block 11 of the subject site by 2007. The subject site has remained relatively unchanged to this time.
- Four of the buildings within the subject site have attached incinerators. The incinerators were used to burn garbage from the 1940’s until the 1970’s, when garbage burning was banned.
- In 1996 and 2000, soil samples were collected from the subject site and analyzed for pesticides. One soil sample from Block 12 contained concentrations of pesticides that exceeded the SROs promulgated in 35 IAC 742 TACO. The Illinois Department of Public Health reviewed the sampling data and prepared the February 16, 2001 Health Consultation letter. The IDPH concluded that no apparent public health hazard exists from exposure to the pesticide residuals detected in surface soil.
- In 2009, additional soil samples were collected from the subject site. Twenty-four of 122 soil samples contained PNAs and/or arsenic that exceeded the SROs promulgated in 35 IAC 742 TACO.
- During the visual inspection of the subject site, the basement and crawl space areas were inaccessible due to flooding. Carnow Conibear was unable to inspect the mechanical equipment located in the basement areas.

8.2 Recognized Environmental Conditions

The ASTM standard defines a REC as the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. This assessment has revealed no evidence of RECs in connection with the subject site, except for the following:

- Four incinerators were observed on the subject site. The incinerators were used to burn garbage from the 1940’s until their use was terminated in the 1970’s. The burning of garbage in the incinerators over that period could contribute contamination from ash, spills, or leaching to the immediate vicinity, and therefore the incinerators are considered a REC to the subject site.

8.3 Controlled Recognized Environmental Conditions

The ASTM standard defines a Controlled REC as a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls. This investigation did not find any Controlled RECs in connection with the subject site.

8.4 Historical Recognized Environmental Conditions

The ASTM standard defines a Historical REC as a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls. This investigation found no Historical RECs in connection with the subject site.

8.5 De Minimis Conditions

The following were found to be *de minimis* conditions, defined as conditions that are not RECs and generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies, as defined in Section 3.2.22 of ASTM E1527-13:

- In 1996 and 2000, soil samples were collected from the subject site and analyzed for pesticides. One soil sample from Block 12 contained concentrations of pesticides that exceeded the SROs promulgated in 35 IAC 742 TACO. The IDPH concluded that no apparent public health hazard exists from exposure to the pesticide residuals detected in surface soil. Therefore, the concentrations of pesticides detected in the 1996 and 2000 sampling events in Blocks 11, 12, and 13 can be considered a de minimis condition to the subject site. If soil is excavated from the areas where concentrations exceeded SROs, the soil should be handled and/or disposed of properly.

- In 2009, additional soil samples were collected from the subject site. Twenty-four of 122 soil samples contained PNAs and/or arsenic that exceeded the SROs promulgated in 35 IAC 742. Carnow Conibear performed a 95% Upper Confidence Limit (UCL) evaluation of the data pursuant to 35 IAC 742.225(d) and (e). The results of this analysis indicate that each 95% UCL concentration is below the corresponding applicable Tier 1 residential ingestion SRO (or median background concentration) for each respective analyte. Therefore, the concentrations of PNAs and arsenic detected in the July 2009 GSG sampling event can be considered a de minimis condition to the subject site. If soil is excavated from the areas where concentrations exceeded SROs, the soil should be handled and/or disposed of properly.

8.6 Business Risks

A business environmental risk refers to a risk which can have a material environmental or environmentally-driven impact on the business associated with the current or planned use of a parcel of commercial real estate, not necessarily limited to those environmental issues required to be investigated as a part of ASTM 1527. This investigation found no business risks in connection with the subject site.

8.7 Data Gaps

When conducting a Phase I ESA investigation, an environmental professionals' ability to identify RECs is sometimes limited due to data gaps. Data gaps are not inherently significant, but can be substantive to a report if other information and/or professional experience raise reasonable concerns regarding the data gap.

One common type of data gap is data failure – the inability to find sources to adequately identify the historical uses of the subject site. ASTM 1527-13 requires that historical uses of a property be identified in five year intervals back to 1940 or the property's first development, whichever is earlier, as long as the information is reasonably ascertainable. If specific use of the property appears unchanged over a period of longer than five years, then research of the use of the property during intervening years is not required.

This investigation has identified sources of information from 1938, 1952, 1962, 1964, 1974, 1975, 1987, 1988, 1992, 1993, 1998, 2002, 2004, 2005, 2007, 2009, 2010, and 2011. Historical information suggests that the subject site had been agricultural land in 1938. By 1945, the subject site was developed with 26 residential buildings, sidewalks, and landscape areas. The electrical building was added to the subject site by 2007. The subject site has remained relatively unaltered since this time.

Carnow Conibear believes based on professional experience, adequate historical information on the subject site was obtained, and the data failure does not represent a significant data gap to the study.

9.0 Conclusions

Carnow Conibear has performed a Phase I Environmental Site Assessment, in conformance with the scope and limitations of the current ASTM Practice E 1527, of the property associated with Blocks 11, 12, and 13 of the Altgeld Gardens housing project located at the northeast corner of South Greenwood Avenue and 133rd Street in Chicago, Illinois (subject site). Any exceptions to, or deletions from, the practice are described in **Section 2.4** of this report. This assessment has revealed no evidence of RECs in connection with the subject site, except for the following:

- Four incinerators were observed on the subject site. The incinerators were used to burn garbage from the 1940's until their use was terminated in the 1970's. The burning of garbage in the incinerators over that period could contribute contamination from ash, spills, or leaching to the immediate vicinity, and therefore the incinerators are considered a REC to the subject site.

The following were found to be *de minimis* conditions, defined as conditions that are not RECs and generally do not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies:

- In 1996 and 2000, soil samples were collected from the subject site and analyzed for pesticides. One soil sample from Block 12 contained concentrations of pesticides that exceeded the SROs promulgated in 35 IAC 742 TACO. The IDPH concluded that no apparent public health hazard exists from exposure to the pesticide residuals detected in surface soil. Therefore, the concentrations of pesticides detected in the 1996 and 2000 sampling events in Blocks 11, 12, and 13 can be considered a de minimis condition to the subject site. If soil is excavated from the areas where concentrations exceeded SROs, the soil should be handled and/or disposed of properly.

- In 2009, additional soil samples were collected from the subject site. Twenty-four of 122 soil samples contained PNAs and/or arsenic that exceeded the SROs promulgated in 35 IAC 742. Carnow Conibear performed a 95% Upper Confidence Limit (UCL) evaluation of the data pursuant to 35 IAC 742.225(d) and (e). The results of this analysis indicate that each 95% UCL concentration is below the corresponding applicable Tier 1 residential ingestion SRO (or median background concentration) for each respective analyte. Therefore, the concentrations of PNAs and arsenic detected in the July 2009 GSG sampling event can be considered a de minimis condition to the subject site. If soil is excavated from the areas where concentrations exceeded SROs, the soil should be handled and/or disposed of properly. USEPA recommended that CHA reduce residents' contact with PAH contaminated soils, including establishing groundcover, placing wood chips, and planting grass.

With respect to the ASTM standard, there were limitations associated with this Phase I ESA. Limitations included:

- Due to flooding, the basement and crawl space areas of the subject site were inaccessible at the time of site inspection.

Carnow Conibear has applied prevailing industry standards and reasonable judgment and effort within the scope of work outlined in Carnow Conibear's proposal, while conducting the Phase I ESA. The standards, judgment, and effort used by Carnow Conibear personnel to investigate, assess, and determine the presence of potential environmental hazards and liabilities associated with the site are consistent with the requirements outlined in the current ASTM Standards No. E1527. Carnow Conibear makes no warranty, express or implied, that the findings and interpretations in this report are a complete representation of the environmental hazards and liabilities, associated with the site. There may be unrecorded information or documentation from previous owners or tenants that is unattainable and may be proprietary, legally protected, or unavailable through government regulatory services.

10.0 Deviations

Carnow Conibear has performed a Phase I Environmental Site Assessment, in conformance with the scope and limitations of the current ASTM Practice E 1527, of the property associated with Blocks 11, 12, and 13 of the Altgeld Gardens housing project located at the northeast corner of South Greenwood Avenue and 133rd Street in Chicago, Illinois (the subject site). Any exceptions to, or deletions from, the practice are described in **Section 2.4** of this report. No other significant deviations are noted with this report.

12.0 Signature & Qualifications of the Environmental Professional

I declare that, to the best of my professional knowledge and belief, I meet the definition of Environmental Professional as defined in §312.10 of 40 CFR 312,

and,

I have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject site. I have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Paul Waite, P. E.
Senior Project Manager

Interview Documentation

Phase I Environmental Site Assessment User Questionnaire

ASTM Standard E1527-13 requires the user of the Environmental Site Assessment to complete the following questionnaire. The questions should be answered to the best of your actual knowledge. Please explain all answers thoroughly, utilizing extra paper as needed.

Property Name & Address: Altgeld Gardens – Blocks 7, 8, 11, 12, &13
E. 131st St. and S. Ingleside Ave., Chicago, IL

(1) What is the reason for conducting this Phase I ESA? (ASTM 1527-13, 6.8)
If no answer is provided, CCA will assume the purpose of the Phase I ESA is to qualify for an LLP to CERCLA liability and will state this in the report.

(2) Do you know of any pending, threatened, or past litigation relevant to hazardous substances or petroleum products in, on, or from the property? (ASTM 1527-13, 10.9)

No

(3) Do you know of any pending, threatened, or past administrative proceedings relevant to hazardous substances or petroleum products in, on, or from the property? (ASTM 1527-13, 10.9)

No

(4) Do you know of any notices from any government entity regarding any possible violation of environmental laws or possible liability relating to hazardous substances or petroleum products? (ASTM 1527-13, 10.9)

No

(5) Environmental cleanup liens that are filed or recorded against the site (40 CFR 312.25).
Are you aware of any environmental cleanup liens against the *property* that are filed or recorded under federal, tribal, state or local law?

No

(6) Activity and land use limitations (AULs) that are in place on the site or that have been filed or recorded in a registry (40 CFR 312.26).
Are you aware of any AULs[1], such as *engineering controls*, land use restrictions or *institutional controls* that are in place at the site and/or have been filed or recorded in a registry under federal, tribal, state or local law?

No

(7) Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28).
As the *user* of this *ESA* do you have any specialized knowledge or experience related to the *property* or nearby properties? For example, are you involved in the same line of business as the current or former *occupants* of the *property* or an adjoining *property* so that you would have specialized knowledge of the chemicals and processes used by this type of business?

No

(8) Relationship of the purchase price to the fair market value of the *property* if it were not contaminated (40 CFR 312.29).
Does the purchase price being paid for this *property* reasonably reflect the fair market value of the *property*? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the *property*?

An evaluation of the purchase price has not been made

(9) Commonly known or *reasonably ascertainable* information about the *property* (40 CFR 312.30).
Are you aware of commonly known or *reasonably ascertainable* information about the *property* that would help the *environmental professional* to identify conditions indicative of releases or threatened releases? For example, as *user*,

(a.)Do you know the past uses of the *property*?

Farming followed by residential

(b.)Do you know of specific chemicals that are present or once were present at the *property*?

No

(c.)Do you know of spills or other chemical releases that have taken place at the *property*?

PCB spill in 1996

(d.)Do you know of any environmental cleanups that have taken place at the *property*?

PCB clean up, USEPA completion letter dated 9/11/2000

(e.)Do you know of any environmental assessments that have taken place at the *property*? If so, please attach copies of the assessment or cleanup reports.

Several USEPA assessments from 8/6/97 to 11/15/2000, reports have been sent on cd

(10) The degree of obviousness of the presence of likely presence of contamination at the *property*, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).
As the *user* of this *ESA*, based on your knowledge and experience related to the *property* are there any *obvious* indicators that point to the presence or likely presence of contamination at the *property*?

No

I have completed the preceding questions in good faith and to the extent of my actual knowledge.

[1] *As defined in 3.2.2 of ASTM Standard E 1527-13, an AUL stands for activity and use limitations – legal or physical restrictions or limitations on the use of, or access to, a site or facility: (1) to reduce or eliminate potential exposure to hazardous substances or petroleum products in the soil, soil vapor, groundwater, and/or surface water on the property, or (2)to prevent activities that could interfere with the effectiveness of a response action in order to ensure maintenance of a condition of no significant risk to public heath or the environment. These legal or physical restrictions, which may include institutional and/or engineering controls, are intended to prevent adverse impacts to individuals or populations that may be exposed to hazardous substances and petroleum products in the soil, soil vapor, groundwater, and/or surface water on the property.*

ABSTRACT

This report presents findings of an analysis of historical aerial photography spanning the period 1938 to 1976. The analysis was performed for the study area known as the Pullman Sewage Farm and the community of Altgeld Gardens in Chicago, Illinois. It consists of approximately 400 acres bordered on the north by 130th Street, on the east by the Calumet Expressway, on the south by the Little Calumet River, and on the west by Indiana Avenue. The collateral information supplied by Region 5 reports that the Pullman Sewage Farm facility had been used as a site for the deposition of liquid wastes from 1881 to 1907. This analysis was requested by Region 5 to document the possible disposal of sewage sludge and landfilling operations that may have taken place before housing was built.

Findings from the analysis indicate that the results of filling activity were observed in 1959 in the northeast quadrant of the Pullman site and later filling was observed in progress in 1967 during the construction of Housing Development 4. The material used for filling could not be identified; it appeared to be light-toned, but it could not be determined what the nature of the material was or if any wastes were incorporated into this material. No evidence of the effluent ditch, referred to in the collateral information, was identified in the period of analysis.

The U.S. Environmental Protection Agency's Characterization Research Division's Monitoring Sciences Branch in Las Vegas, Nevada, prepared this report for the Agency's Hazardous Waste Management Division in Region 5 in Chicago, Illinois, and the Office of Emergency and Remedial Response in Washington, D.C.

INTRODUCTION

This report presents findings of an analysis of historical aerial photography spanning the period 1938 to 1976. The analysis was performed for the study area known as the Pullman Sewage Farm and the community of Altgeld Gardens in Chicago, Illinois. The study area consists of approximately 400 acres bordered on the north by 130th Street, on the east by the Calumet Expressway, on the south by the Little Calumet River, and on the west by Indiana Avenue. This analysis was requested by Region 5 to document the possible disposal of sewage sludge and landfilling operations that may have taken place before housing was built.

The collateral information supplied by Region 5 reports that the Pullman facility had been used as a site for the deposition of liquid wastes from 1881 to 1907. The following is a summary of the Pullman site background information supplied by EPA Region 5: The Pullman Sewage Farm was actively used as a disposal area for municipal waste for a span of sixteen years, from 1881 to 1907. The sludge consisted of municipal sewage and industrial waste associated with a railcar factory. It was transported through subterranean pipes from the town of Pullman in the north to a hydrant located on the farm, from which it was allowed to flow over the soil. Buried in the soil were three- to four-inch farm tiles which provided underdrainage for the filtration process. The untreated effluent flowed to ditches which then carried it to the Little Calumet River. In addition to being used to filter the sewage, the soil was also used by the Pullman Land Association to grow cash crops. Accounts published in 1893 documented eye-witness reports of the discharging of "crude sewage" into the Lake even prior to 1887. "The sewage was being run in a large open ditch...from near the farm to the lake [Calumet]". Reportedly this procedure was done to protect the cash crops being grown on the Pullman Sewage Farm.

The U.S. Environmental Protection Agency's Characterization Research Division's Monitoring Sciences Branch in Las Vegas, Nevada, prepared this report for the Agency's Hazardous Waste Management Division in Region 5 in Chicago, Illinois, and the Office of Emergency and Remedial Response in Washington, D.C.

METHODOLOGY

Stereoscopic pairs of historical aerial photographs were used to perform the analysis. Stereo viewing enhances the interpretation because it allows the analyst to observe the vertical as well as horizontal spatial relationships of natural and cultural features. Stereoscopy is also an aid in distinguishing between various shapes, tones, textures, and colors that can be found within the study area.

Evidence of waste disposal is a prime consideration when conducting a hazardous waste site analysis. Leachate or seepage resulting from burial and dumping of hazardous materials might threaten existing surface or ground-water resources. Pools of unexplained liquid are routinely noted because they can indicate seepage from buried wastes and may enter drainage channels that allow contaminants to move off the site. An excellent indicator of how well hazardous materials are being handled at a site is the presence or absence of spills, spill stains, and vegetation damage. Trees and other forms of vegetation that exhibit a marked color difference from surrounding members of the same species are labeled "stressed," "damaged," or "dead" based upon the degree of noticeable variation. Vegetation is so labeled only after consideration of the season in which the photography was acquired.

Drainage analysis identifies the direction a spill or surface runoff would follow. Direction of drainage is determined from analysis of the photographs and from U.S. Geological Survey topographic maps. Whenever they are available, 7.5-minute quadrangle maps (scale 1:24,000) are used to show site location and to provide geographic and topographic information. Site boundaries or areas used in this analysis were determined from observations made from aerial photographs in conjunction with collateral data supplied by Region 5 and do not necessarily denote legal property lines or ownership.

Results of the analysis are shown on annotated overlays attached to the photos. The following table provides documentation of the photographs used in this report:

PHOTO ANALYSIS

NOVEMBER 14, 1938 (FIGURE 3)

Collateral information indicates that sewage disposal had ceased at the Pullman Sewage Farm in 1907. At this time, in the northwest quadrant of the Pullman Sewage Farm area, the ground appears to be undergoing railway demolition and road construction. At a bend of the Little Calumet River (which lies northwest of the study area) an outfall and dark plume are noted, but the source of the discharge is unknown. At the center of the Pullman Sewage Farm area there is a square lot with a building (Building 1); this lot is a location of a school in 1996. In the northeast quadrant of the Pullman Sewage Farm area the land is cleared and appears to be either turf or under cultivation. In the southeast quadrant of the study area there is a small lot with buildings which appears to be a farmstead (Annotation A). In the southwest quadrant of the Pullman Sewage Farm area a housing development (Housing Development 1) is extant and is comprised of three sections, each section contains approximately twenty structures. No evidence of waste disposal activity is noted.

MARCH 29, 1952 (FIGURE 4)

The northwest quadrant of the Pullman Sewage Farm area continues to be disturbed by construction activity. An exposed pipe is visible in this area. Much of the study area appears to be either turf or undergoing cultivation. Outside the northeast perimeter of the Pullman Sewage Farm area, there are drainage depressions leading toward the Pullman Sewage Farm area from the Altgeld Gardens housing development. The buildings denoted by Annotation A appear unchanged. No evidence of waste disposal is noted.

SEPTEMBER 3, 1959 (FIGURE 5)

Golden Gate Park is under construction across 130th Street from the northwest perimeter of the study area. In the northeast corner of the Pullman Sewage Farm area is a rectangular lot with a complex of buildings; the remaining surface of the lot appears to be smooth fill. A school has been built adjacent to this lot. Lawrence Avenue has been constructed along the eastern perimeter of the Pullman Sewage Farm area. The buildings denoted in previous years by Annotation A are no longer visible. No evidence of waste disposal is noted.

AUGUST 28, 1967 (FIGURE 6)

In the northwest quadrant of the study area there is a pipe trench extending from the road. Annotation B denotes the location of buildings inside the study area which seem to be a part of a nearby train depot. Buildings and a circular storage tank have been built on the location of the fill area previously noted in the northeast quadrant of the Pullman Sewage Farm area. In the southeast quadrant of the Pullman Sewage Farm area a housing development (Housing Development 2) has been built over the location of Annotation A (Figure 3); it is probably an expansion of the Altgeld Gardens housing development. A third housing development (Housing Development 3) is in the initial stages of construction, surrounding Building 1.

ABSTRACT

This report is an addendum to TS-PIC 9605510. It presents the results of an aerial photographic analysis of the Altgeld Gardens extended study area located in Chicago, Illinois. The Altgeld Gardens extended study area occupies approximately 570 acres and is comprised of two main areas, the Pullman Sewage Farm and the Altgeld Gardens Housing Development, which are separated by Lawrence Avenue. The primary data used for this report are two selected dates of black-and-white photographs: November 14, 1938 and September 3, 1959. This analysis was requested to document the possible disposal of sewage sludge and landfilling operations that may have taken place before housing was built in the Altgeld Gardens extended study area.

Findings from the analysis indicate evidence of a possible drainageway in the Altgeld Gardens Housing Development Area in 1938. The poor resolution of the photograph precludes a detailed description of the function of the possible drainageway. The landfilling operations that took place in 1959 at the Pullman Sewage Farm Area and at the Altgeld Gardens Housing Development Area appeared to be related to building construction. The material used for filling appeared to be light- to medium-toned. It could not be determined what the nature of the material was or if any wastes were incorporated into this material.

The U.S. Environmental Protection Agency's Characterization Research Division's Monitoring Sciences Branch in Las Vegas, Nevada, prepared this report for the Agency's Hazardous Waste Management Division in Region 5 in Chicago, Illinois, and the Office of Emergency and Remedial Response in Washington, D.C.

INTRODUCTION

This report presents the results of an aerial photographic analysis of the Altgeld Gardens extended study area located in Chicago, Illinois (Figures 1 and 2). The primary data used for this report are two selected dates of black-and-white photographs: November 14, 1938 and September 3, 1959.

The Altgeld Gardens extended study area occupies approximately 570 acres and is comprised of two main areas, the Pullman Sewage Farm and the Altgeld Gardens Housing Development, separated by Lawrence Avenue. The Pullman Sewage Farm Area consists of approximately 140 acres bordered on the north by 130th Street, on the east by Lawrence Avenue, on the south by 134th Street, and on the west by Indiana Avenue. Collateral information supplied by Region 5 indicates that it operated for sixteen years (1881-1907) as a disposal site of sewage sludge originating from the town of Pullman to the north and reportedly included a ditch which carried effluent to Lake Calumet (for a summary of the collateral information supplied by Region 5, please refer to previous report TS-PIC-9605510). The Altgeld Gardens Housing Development Area consists of approximately 430 acres bordered on the north by 130th Street, on the east by Lawrence Avenue, on the south by the Little Calumet River and on the east by the Calumet Expressway (note: the actual Altgeld Gardens housing development does not extend to the Calumet Expressway). This analysis was requested to document the possible disposal of sewage sludge and landfilling operations that may have taken place before housing was built in the Altgeld Gardens extended study area.

The U.S. Environmental Protection Agency's Characterization Research Division's Monitoring Sciences Branch in Las Vegas, Nevada, prepared this report for the Agency's Hazardous Waste Management Division in Region 5 in Chicago, Illinois, and the Office of Emergency and Remedial Response in Washington, D.C.

METHODOLOGY

Stereoscopic pairs of historical aerial photographs were used to perform the analysis. Stereo viewing enhances the interpretation because it allows the analyst to observe the vertical as well as horizontal spatial relationships of natural and cultural features. Stereoscopy is also an aid in distinguishing between various shapes, tones, textures, and colors that can be found within the study area.

Evidence of waste disposal is a prime consideration when conducting a hazardous waste site analysis. Leachate or seepage resulting from burial and dumping of hazardous materials might threaten existing surface or ground-water resources. Pools of unexplained liquid are routinely noted because they can indicate seepage from buried wastes and may enter drainage channels that allow contaminants to move off the site. An excellent indicator of how well hazardous materials are being handled at a site is the presence or absence of spills, spill stains, and vegetation damage. Trees and other forms of vegetation that exhibit a marked color difference from surrounding members of the same species are labeled "stressed," "damaged," or "dead" based upon the degree of noticeable variation. Vegetation is so labeled only after consideration of the season in which the photography was acquired.

Drainage analysis identifies the direction a spill or surface runoff would follow. Direction of drainage is determined from analysis of the photographs and from U.S. Geological Survey topographic maps. Whenever they are available, 7.5-minute quadrangle maps (scale 1:24,000) are used to show site location and to provide geographic and topographic information. Site boundaries or areas used in this analysis were determined from observations made from aerial photographs in conjunction with collateral data supplied by Region 5 and do not necessarily denote legal property lines or ownership.

Results of the analysis are shown on annotated overlays attached to the photos. The following table provides documentation of the photographs used in this report:

ANALYSIS SUMMARY

The primary data used for this report are two selected dates of black-and-white photographs: November 14, 1938 and September 3, 1959. This analysis was requested to document the possible disposal of sewage sludge and landfilling operations that may have taken place before housing was built in the Altgeld Gardens extended study area.

Findings from the analysis of 1938 photographs indicated evidence of a possible drainageway in the Altgeld Gardens Housing Development Area, but the poor resolution of the photograph precluded a detailed description of the function of these features. The landfilling operations that took place in 1959 at the Pullman Sewage Farm Area and at the Altgeld Gardens Housing Development Area appeared to be related to building construction. The material used for filling appeared to be light- to medium-toned but it could not be determined what the nature of the material was or if any wastes were incorporated into this material.

PHOTO ANALYSIS

NOVEMBER 14, 1938 (FIGURE 3)

The first date of analysis shows the Pullman Sewage Farm Area after it was known to have last been in operation (circa 1907) and the Altgeld Gardens Housing Development Area prior to the building of the actual Altgeld Gardens housing development (circa 1952). At the Pullman Sewage Farm Area in the northwest quadrant the ground appears to be undergoing rail-line demolition and road construction. Building 1 is a square lot; this lot is the current location of a school. In the northeast quadrant the land is cleared and appears to be either turf or under cultivation. In the southeast quadrant is a small lot with buildings (Annotation A). In the southwest quadrant a housing development (Housing Development 1) is already extant and is comprised of three sections, where each section contains approximately twenty structures. At the Altgeld Gardens Housing Development Area extended, linear segments of a possible drainageway are discernible in the northwest and southeast quadrants, but the poor resolution of the 1938 photograph precluded a detailed description of the function of these features. The land is mostly cleared and continues to appear either turf or under cultivation, but with no discernible buildings. There are intermittent patches of larger vegetation and the general surface runoff flows south.

SEPTEMBER 3, 1959 (FIGURE 4)

Locations of features and/or structures previously reported on the 1938 photograph are annotated on this photograph to serve as reference points. The second date of analysis shows the extended study area 21 years later. At the Pullman Sewage Farm Area the northeast corner is a rectangular lot with a complex of buildings already extant. The remaining surface of the lot appears to be smoothed construction fill. Adjacent to this lot, but within the Altgeld Gardens Housing Development Area, a school is noted as already extant. Lawrence Avenue has been constructed along the eastern perimeter of the sector. At the Altgeld Gardens Housing Development Area the actual Altgeld Gardens housing development is extant. There are smoothed fill areas just north of 134th Street which indicate construction in progress.

1. *Introduction*

The United States Environmental Protection Agency (U.S. EPA) Southeast Chicago Site Assessment Team (SAT) requested the Superfund Division Emergency Response Branch (ERB) and the Superfund Division Technical Support Section (TSS) to assess the possible presence of soil contamination at the Altgeld Gardens Community (AGC) located in Chicago, Cook County, Illinois.

On-Scene Coordinator Charles Gebien and Keith Lesniak of U.S. EPA ERB were tasked to perform the site assessment and to determine if conditions are present at the AGC which present an imminent and substantial threat to public health and welfare and the environment. The Chicago Housing Authority (CHA) was advised of proposed assessment work and participated in sampling activities.

2. Background

2.1 Site Description

The Altgeld Gardens community (AGC) is a low-income housing development that is managed by the Chicago Housing Authority (CHA). The AGC is located near Interstate 94 and 130th Street, Chicago, Cook County, Illinois (Figure 2-1). The AGC is bounded on the north by 130th Street, on the south by the Little Calumet River, on the east by the Beaubien Woods, and on the west by St. Lawrence Avenue (Figure 2-2). Approximately 10,000 residents live in the AGC.

2.2 Site History

The AGC was constructed in approximately 1941, atop an agricultural area. Residents of the AGC have indicated that canals from the Pullman Sewage Farm carried sewage wastes from industrial areas north of the AGC, through the AGC, and southward to the little Calumet River, until the 1950s. Many residents complain that health problems including skin rashes and asthma are prevalent in the AGC. Two soil samples collected from the AGC as part of a 1990 U.S. EPA Site Screening Inspection (SSI) and 1994 Expanded Site Inspection (ESI) for the Pullman Sewage Farm identified elevated levels of PAHs, pesticides, and heavy metals in surface soil (Refer to Table 4-4). The Illinois Department of Public Health (IDPH) has recommended that additional soil testing is justified at the AGC, particularly in areas where children play. The contaminants of concern are pthalates, PCBs, PAHs, heavy metals, pesticides, and VOCs.

On July 18, 1996, OSC Gebien, U.S. EPA ERB, completed a Sampling QA/QC Work Plan (SWP) for sampling activities planned at the AGC. The sample locations that are included in the SWP were chosen by interviews with AGC leaders and are based on complaints of contamination in each of the locations. In August 1996, the U.S. EPA Characterization Research Division completed an aerial photographic analysis of the Pullman Sewage Farm and the AGC area. In November 1996, an addendum was added to further interpret historical drainage ways which appear in 1938 aerial photos of the AGC (Refer to Appendix A for the Aerial Photographic Analysis of Altgeld Gardens). The 1938 aerial photo shows the AGC property in cultivation prior to construction of housing units and depicts possible drainage ways.

3. Site Assessment

On July 18, 1996 OSC Charles Gebien and Keith Lesniak visited the AGC area, after a major storm event to observe and photo document possible flooding conditions. On July 22, 1996, OSC Gebien and Lesniak met at AGC with Mr. Fred Chang, P.E., Environmental Unit, CHA, to collect water samples from areas of chronic standing water within the AGC. Standing water samples were collected from seven locations (Figure 2-2) were collected from the following locations; Block 15 (SO1), Block 12 (SO5), Block 16 (SO6), Block 17 (SO7), Block 3 (SO2), Block 4 (SO3), Carver High School (SO9). Refer to Table 3-1 for further sample location and description information and to Appendix C for photographs taken during the flooding observation and water sampling activities. Sampling was conducted in level D protection. The samples were delivered to the U.S. EPA Central Regional Laboratory (CRL), Chicago, Illinois. The water samples were analyzed for ABN, pesticides/polychlorinated biphenyls (PCBs), volatile organic analytes (VOAs), metals, mercury, and cyanide.

On August 21, 1996 OSC Charles Gebien and Keith Lesniak returned to the AGC area, and met with Mr. Fred Chang, P.E., Environmental Unit, CHA, to collect soil samples from areas within the AGC which are suspected areas of contamination. Soil samples were collected from the surface of the ground at ten locations (Figure 2-2). Samples were collected from the following locations; Block 16 (S17), Block 17 (S18), Block 3 (S13), Block 4 (S14), Carver Primary School Courtyard on Corliss St (S21), Block 15 (S12), Block 12 (S16), Carver High School (S20), Block 11 (S15) and WIC Clinic (S19). Refer to Table 3-2 for additional sample description and location information and to Appendix C for photographs taken during the soil sampling activities. Sampling was conducted in level D protection. The samples were delivered to the U.S. EPA Central Regional Laboratory (CRL), Chicago, Illinois. The soil samples were analyzed for ABN, pesticides/PCBs, VOAs, metals, mercury, and cyanide.

On November 11, 1996, OSC Charles Gebien and Keith Lesniak returned to the AGC area, and met with Steve Peterson, Alan Gebien, and Tom Sedlacek. Mr. Fred Chang, CHA, was not present due to other obligations. The purpose of the visit was to investigate subsurface soils in historical drainage areas within the AGC, which were identified through aerial photographic analysis as potential routes of contamination from the former Pullman Sewage Farm. Four former drainage ways were chosen for Geoprobe sampling, and one Geoprobe boring was performed in each drainage way. Subsurface soil samples were collected from the four Geoprobe boring locations as shown in Figure 2-

2. Samples were collected as follows; Geoprobe I 2'-4' (S01), 4'-6'(S02), Geoprobe II 2'-4' (S03), 4'-6' (S04), 6'-8' (S11), Geoprobe III 2'-4' (S05), 4'-6' (S06), Geoprobe IV 2'-4' (S07), 4'-6' (S08) and 6'-8' (S09). Refer to Table 3-3 for further sample description and location information. Photographs were not taken during the Geoprobe soil sampling activities. Sampling was conducted in level D protection. The samples were delivered to the U.S. EPA Central Regional Laboratory (CRL), Chicago, Illinois. The soil samples were analyzed for ABN, pesticides/PCBs, VOAs, metals, mercury, and cyanide.

On March 25,1997, OSC Charles Gebien and Keith Lesniak returned to the AGC area, and met with Mr. Fred Chang, CHA. The purpose of the visit was to collect additional surface soil samples in Block 11, because elevated levels of PAHs were identified from our earlier surface soil sample in that block. Four samples were collected from a courtyard lawn area as follows: front of Unit 13055 (S01), front of Unit 1128 (S02), front of Unit 1114 (S03), and front of Unit 13073 (S04). Refer to Table 3-4 for further sample description and location information.

S03	Soil	Sample from grassy area in courtyard near unit 1114 in Block 11.
S04	Soil	Sample from grassy area in courtyard near unit 13073 in Block 11.

4. Analytical Results

The water samples, surface soil samples, and sub-surface samples were analyzed for ABN, pesticides/polychlorinated biphenyls (PCBs), volatile organic analytes (VOAs), metals, mercury, and cyanide. All samples were analyzed at the U.S. EPA Central Regional Laboratory (CRL), Chicago, Illinois.

Analytical results indicate that slightly elevated levels of PAH compounds may be present in the surface soils within the AGC area. PAH data is summarized for standing water, surface soils, and sub-surface soils in tables 4-1, 4-2, and 4-3. Refer to Appendix B for CRL analytical reports and corresponding QA/QC reviews.

5. Discussion of Potential Threats

Analyses of surface soils, sub-surface soils and standing water within the AGC indicate that although elevated levels of PAHs were identified in surface soils within block 11, the levels do not exceed the recommended removal action level (RAL) for total PAHs (500-1000 PPM total PAHs) established in the "Emergency Removal Guidelines". Information from this report is being reviewed by U.S. EPA for a health based risk assessment.

There are no conditions present in the areas assessed at the AGC that may present an imminent and substantial threat to public health and welfare and the environment, based on considerations set forth in paragraph (b) (2) of Section 300.415 (b) (2) of the National Oil and Hazardous Substances Contingency Plan (NCP).

6. Removal Activities

There were no conditions observed at the AGC during the site assessment which warrant a removal action.

FACT SHEET

Altgeld Murray Gardens

Chicago, Illinois

May 1998

Introduction

The United States Environmental Protection Agency (US EPA) in conjunction with the Chicago Housing Authority (CHA), has prepared this fact sheet to inform residents of US EPA's past sampling activities in the area, and to provide information regarding the results of these activities.

Background Information

Altgeld Gardens (AG) is located near Interstate 94 and 130th Street in Chicago, Illinois. AG is bounded on the north by 130th Street, on the south by the Little Calumet River, on the east by the Beaubien Woods, and on the west by St. Lawrence Avenue. AG houses 5,780 residents and is owned by the (CHA), but managed by a private company. The AG community was constructed during the years 1944-1952, atop an agricultural area. Residents of the area are concerned that canals from the Pullman Sewage Farm, located to the east of the complex, may have carried sewage wastes from industrial areas north of AG and southward to the little Calumet River until the 1950s. There was also a belief by some community residents that AG was built on a landfill.

Investigation History

- ☐ In 1990, at the community's request, US EPA conducted background soil sampling in AG as part of a Site Screening Inspection (SSI) of the Pullman Sewage Site. Background samples are taken in most areas where US EPA is conducting inspections in order to determine the extent of contamination.

- ☐ In 1994, subsequent soil samples were taken as a follow-up to the 1990 samples. US EPA identified elevated levels of polycyclic aromatic hydrocarbons (PAHs), pesticides, and heavy metals in some of the background samples from the Expanded Site Inspection (ESI) conducted for the Pullman Sewage Farm in 1994. PAHs are common by-products of combustion. Sources include cars, trucks, smokestacks, and even bar-b-ques.

☐ In 1996, US EPA observed and photo documented AG after a major storm event to identify possible flooding conditions. Water samples were then collected from seven locations in the area.

☐ In August 1996, US EPA also worked with CHA's environmental unit to collect soil samples at ten locations. The areas were selected after interviewing community leaders.

☐ In November 1996, US EPA investigated the subsurface soils in drainage areas on the site. Evidence from the aerial photos and soil samples do not indicate that there was transport of waste materials from the Pullman Sewage Farm to the Altgeld property.

☐ Finally, in March 1997, additional soil samples were collected in Block 11 (130th Place & Doty Avenue) because elevated levels of PAHs were identified from earlier surface soil sampling results. Four samples were collected from a courtyard lawn area in front of Units 1128 and 1114, and in front of several other street addresses.

Results

During EPA investigations in 1996 and 1997, water, surface soils, and sub-surface samples were collected from various location with Altgeld Murray Gardens. These samples were analyzed by the US EPA Central Regional Laboratory in Chicago for polychlorinated biphenyls (PCBs), volatile organic compounds (VOCs), semi-volatiles, and metals. Of the chemicals detected in these samples, PAHs and DDT pesticides were identified as chemicals that requires an evaluation for their potential health effects. DDT and DDE, were generally detected in very low levels in these samples. The highest detected level of DDT, at 31 parts per million (ppm) in Block 16. This level of DDT is not considered to be either an immediate or long-term health concern.

PAHs were detected at Altgeld Gardens in about 40 percent of the surface soil samples. The detected PAHs were generally at very low levels (<0.5 ppm for the most toxic PAH, benzo(a)pyrene (BaP)). The highest detected concentration of BaP was 2.5 ppm, which occurred in Block 11 (130th Place & Doty Avenue). The four additional samples collected in that area in March, 1997 did not detect BaP or any other PAH. These levels of PAHs are not considered to be an immediate health concern and are similar to levels found in studies of other urban areas. To confirm that these levels are representative of Chicago background levels, an additional investigation is planned to specifically evaluate the background levels of PAHs in various residential areas of Chicago and to compare those levels to those found at Altgeld Gardens.

To evaluate the potential for long term, chronic effects of exposure, a screening risk assessment was performed, using the maximum detected surface soil sampling data for the site. The risk assessment considered soil ingestion and dermal absorption as the most important pathways for exposure. Using very conservative methods for evaluated, dermal exposure to PAHs accounts for about 70 percent of the risk in our analysis. The objective of this assessment is to predict future risks of continuous lifetime exposure, rather than evaluate whether people may be affected by current exposure at the site. Using USEPA risk assessment methodology, the lifetime excess cancer risk for exposure to the highest concentration of PAHs ranged from 2 x 10 (2 out of 10,000 exposed individuals) to 3 x 10 (3 out of 1,000 exposed individuals). In interpreting these estimates, one should keep in mind these are risks that are likely to be very similar to those experienced in any other urban site. In addition, the sampling results, as well as aerial photos of the area, reveal no physical evidence that Altgeld Gardens was built on a landfill or evidence of industrial contamination in the surface soil.

Future Actions

At this time US EPA has determined that additional sampling in the Altgeld Gardens is not necessary because Altgeld Garden levels were similar to those identified in studies of other urban areas. However, US EPA is conducting a PAH and lead background study to verify PAH and lead background levels for the City of Chicago. Information gathered in this study will be used to help determine future cleanup action levels for urban sites in general.

GLOSSARY

Volatile Organic Compounds (VOCs) and **Semi-Volatile Organic Compounds (semi-VOC's)** - An organic (carbon-containing) compound that evaporates readily at room temperature. Examples of VOC's include dry cleaning fluid, lighter fluid, paint thinners and components of gasoline.

Pesticides - Substances or mixture thereof intended for preventing, destroying, repelling, or mitigating crop. EPA sets these levels well below the point where the compounds might be harmful to consumers.

DDT - the first chlorinated hydrocarbon insecticide (chemical name: Dichloro-Diphenyl-Trichloromethane). It has a half-life of 15 years and can collect in fatty tissues of certain animals. EPA banned registration and interstate sale of DDT for virtually all but emergency uses in the United States in 1972 because of its persistence in the environment and accumulation in the food chain.

Chicago, Illinois 60643

Re: Altgeld Gardens Housing Complex

Dear Mr. Jain:

This letter is written to you with a recommendation that the Chicago Housing Authority (CHA) take appropriate actions to reduce the potential exposure at the Altgeld Gardens Housing Complex to polynuclear aromatic hydrocarbons (PAHs) detected in surface soils.

As you know, U.S. EPA has been involved in various soil sampling activities at the Altgeld Gardens Property. The most recent sampling took place in 1996, after a request was made by the community to look into possible soil contamination. The results of the sampling effort were presented to community representatives, specifically Hazel and Cheryl Johnson, People for Community Recovery (PCR), and Keith Harley, Chicago Legal Clinic, on July 20, 1998, at the U.S. EPA's office. We also tried to invite a representative from the Altgeld Gardens Local Advisory Board, but attempts to contact Mrs. Wheeler yielded a phone message indicating that the line had been disconnected. In addition, Lisa Schneider and Jaote Wawatu from the CHA were also present at this meeting.

U.S. EPA could find no evidence of release of PAHs from specific sources, and suspects that atmospheric deposition from point, area, and mobile sources are most likely responsible for the contamination. A comparison of PAH levels detected at Altgeld Gardens to those found in other urban areas indicated that the Altgeld values were within the expected range. However, the highest value of 2.5 ppm has the potential to cause adverse health effects through dermal contact under certain exposure assumptions. While this level would not support a Superfund removal action, we believe it is prudent to take some common sense steps to reduce or eliminate the exposure pathway.

Therefore, U.S. EPA strongly recommen CHA, as property owner, take appropriate measures to reduce the residents' contact with PAH contaminated soils. Appropriate measures to reduce exposure could include establishing groundcover, such as placing wood chips over surface soils in play lots and/or planting grass in court yard areas where the elevated PAH levels were found. These activities will greatly reduce risk to children and adults by eliminating direct contact with contaminated soils. These measures may also result in the reduction of the PAH compounds through a natural process known as phyto-remediation. In addition, Northwestern Unliversity may shortly provide us with other options to reduce the exposure pathway.

U.S. EPA would also like to invite CHA to partner in a project that would address this issue at Altgeld Gardens by establishing and maintaining groundcover with community support. The project would consist largely of education and outreach activities to Altgeld Gardens residents, and other stakeholders, in order to address the PAH issue.

Should you have any questions or concerns, please feel free to contact Mardi Klevs, Greater Chicago Team Manager, at (312) 353-5490.

Sincerely yours,

Wm. E. Muno

Re: Altgeld Gardens Community

Dear Mr. Bishop:

As promised in the July 28, 2000, letters responding to your Freedom of Information Act request, we are writing to provide you with information concerning the potential analytical problems involving the United States Environmental Protection Agency's (U.S. EPA) Central Regional Laboratory, and U.S. EPA's proposal to conduct core sampling for Polychlorinated Biphenyls (PCBs) in the yards on the north side of the Dorothy Gautreax Child Parent Center, 975 E. 132nd Street, Chicago, Illinois (Gautreax Center), and surface soil and surface water sampling in the area throughout the community housing, as in the enclosed figure.

During the spring of 1996 the Chicago Housing Authority (CHA) conducted a cleanup of soil contaminated with PCBs, a chemical regulated under the Toxic Substances Control Act, from the yards on the north side of the Gautreax Center. The source of the PCB contamination was a storage lot located across the street from the Gautreax Center where the CHA had disposed PCBs from electrical transformers. During the cleanup, approximately one foot of soil was excavated across the entire north side of the Gautreax Center, cleanup confirmation samples were collected, and the area was backfilled with clean soil trucked in from off site. U.S. EPA, Region 5, conducted oversight of the CHA's cleanup and assisted the CHA by providing laboratory analysis of the CHA's samples. Based on the sample analysis, Region 5 determined that the PCB cleanup level of less than 10 parts per million (ppm) had been met, and the area could be backfilled to grade with clean soil.

During 1996 and 1997, U.S. EPA also conducted surface soil and water sampling in certain areas of the housing complex in response to residents' concerns with potential contamination. The surface soil samples and surface water samples were analyzed for a full range of contaminants. Low levels of polycyclic aromatic hydrocarbons (PAHs), mainly Benzo(a)pyrene and low levels of DDD, DDT and DDE, were found in the soil samples. Although results were below action levels, U.S. EPA recommended to the CHA that a grass cover be placed in areas where bare soil was present. This grass cover prevents direct contact with soil.

Since these actions, allegations of misconduct in the analysis of samples have been made regarding two employees of U.S. EPA's Central Regional Laboratory and two contract employees who analyzed samples for Region 5's Superfund Program. The Office of the Inspector General is conducting an investigation of the alleged misconduct which relates to failures to follow standard laboratory operating procedures. Because of these allegations, U.S. EPA has determined that data generated from samples analyzed by these individuals will not be relied on for its decisions. U.S. EPA has determined that two sampling events at the Gautreax Center resulted in final cleanup decisions based solely on analytical results which were provided by one of the analytical chemists in question. On April 23 and May 8, 1996, soil samples were collected for PCB analysis from the excavation on the north side of the Gautreax Center. These results are identified by data set numbers 960073 and 960084. Because the 1996 analyses were performed by one of the analytical chemists in question, U.S. EPA now considers these particular analytical results to be unreliable Even though U.S. EPA has reviewed the 1996 raw analytical data and cannot conclude that there was any failure to follow analytical procedures which caused the analytical results to be lower than target levels indicating a need for cleanup, U.S. EPA believes the most prudent course of action is to resample this area. U.S. EPA must emphasize that the north yards are covered by approximately one foot of clean soil and do not present a significant risk to children attending the Gautreax Center or to the nearby community. It should also be noted that no similar problems have been found with the cleanup at the Altgeld Gardens storage lot, which was completed last summer.

With regard to the Superfund sampling, data from the sampling events in soil and water were reviewed and only certain chemical analysis was performed by these individuals. This was the case for pesticides in water and soils and for organic contaminants in soils, identified by data set numbers 960131, 960152 and 970025. Therefore, all locations will need to be resampled by U.S. EPA. However, samples will only be analyzed for pesticides and volatile organic compounds.

U.S. EPA intends to conduct this sampling by the middle of September.

If you have questions, please contact Scott Cooper, for the PCB sampling at (312) 886-1332 and Rosita Clarke-Moreno at (312) 886-7251, for the Superfund soil and water sampling.

Sincerely,

Robert Springer

Re: Altgeld Gardens
Chicago, Cook County, Illinois
TDD: S05-0008-010
PAN: 0G1001SIXX

Dear Ms. Nabasny:

The United States Environmental Protection Agency (U.S. EPA) tasked the Superfund Technical Assessment and Response Team (START) contractor, Ecology and Environment, Inc. (E & E), under Technical Direction Document (TDD) S05-0008-010, to assist U.S. EPA Remedial Project Manager (RPM) Rosita Clarke-Moreno with a site assessment at the above referenced site. The purpose of the site assessment was to resample surface soil locations on the Altgeld Gardens Community (AGC) that were originally sampled by U.S. EPA in 1996 and 1997 and analyzed for polyaromatic hydrocarbons (PAHs) and pesticides. Analytical results from that sampling effort are suspect because the analyses were performed by the Central Regional Laboratory (CRL). Recent investigations have determined that certain analytical data, including pesticide analyses, generated by CRL at the time of the U.S. EPA Altgeld Gardens soil sampling event may be erroneous.

The AGC site is a housing development managed by the Chicago Housing Authority (CHA) located south of 130th Street just west of Interstate 94 in Chicago, Cook County, Illinois (Attachment A, Figure 1). The AGC is bounded on the north by 130th Street, on the south by the Little Calumet River, on the east by the Beaubien Woods forest preserve, and on the west by St. Lawrence Avenue. Approximately 10,000 residents live in the AGC.

The AGC was constructed in 1941 on former farm land and several backfilled ditches that may have contained industrial effluent and debris. Many residents of the AGC have complained that health problems, including skin rashes and asthma, are prevalent in the community. Two soil samples collected from the AGC property in 1990 during a U.S. EPA investigation identified elevated levels of PAHs, pesticides, and heavy metals in surface soil. The Illinois Department of Public Health recommended additional soil sampling on AGC property, particularly in areas where children play.

In 1996, at the request of community leaders, U.S. EPA conducted a site investigation of the AGC property, including sampling of soil and standing water, to determine whether hazardous materials were present due to reported landfilling in the area. Results of this sampling and analysis indicated PAHs, and

PAHs, and the pesticides DDT, DDD, and DDE as contaminants of concern. The U.S. EPA analytical pesticide data is given in Attachment B, Table 1. At one sample location, S17, in housing Block 16 (Attachment A, Figure 2), the concentrations of pesticides were found to be above Agency for Toxic Substances and Disease Registry (ATSDR) screening criteria. Maximum concentrations found were: DDT at 31,399 micrograms per kilogram (μg/kg), DDD at 5,841 μg/kg, and DDE at 31,595 μg/kg.

In April of 1999, START performed a more detailed round of surface soil sampling in the vicinity of Block 16, collecting 10 located samples plus one duplicate and one off-site background sample. Analytical results, detailed in a Letter Report dated May 28, 1999, revealed the presence of pesticides in every sample, including the background sample. In on-site soils, 4,4'-DDD ranged from 30 to 570 μg/kg; 4,4'-DDE ranged from 660 to 17,000 μg/kg; and 4,4'-DDT ranged from 340 to 7,900 μg/kg. Aldrin was detected in one sample at 32 μg/kg, and dieldrin was detected in one sample at 15 μg/kg.

Under the present TDD, RPM Clarke requested that START return to the AGC site, resample the 1996-1997 U.S. EPA surface soil locations, and have the samples analyzed for pesticides at a commercial laboratory. On October 4, 2000, START members Larry Lueck and Erin White mobilized to the site and collected 10 surface soil samples, as well as a duplicate of one sample, using site file information to determine the 1996-1997 locations as well as possible (Attachment A, Figure 2). Each sample was a grab sample collected from the surface to a depth of 2 to 3 inches with a stainless steel trowel. Where turf was present, attention was given to freeing soil from the grass roots to ensure that the surface was truly represented. The soil was then homogenized in a stainless steel bowl and packed into an 8-ounce wide-mouth glass sample bottle and stored on ice in a cooler. Trowels and bowls were decontaminated with Alconox solution and rinsed with commercial distilled water between samples. Dates, times, and locations of sample collection are given in Attachment B, Table 2. Attachment C presents photographs of each sample location.

START labeled each sample bottle with a unique sample number, and the date and time of collection, and shipped the samples with a completed chain of custody form to the Ecology and Environment, Inc., Analytical Services Center in Lancaster, New York, for analysis of pesticides and polychlorinated biphenyls (PCBs) under analytical TDD S05-0008-804.

A summary of the START analyses is given in Attachment B, Table 3, which also lists the U.S. EPA Region III risk-based concentrations (RBCs) for comparison. Various pesticides were detected in every soil sample in concentrations from near the respective detection limits to 25,000 μg/kg DDE and 16,300 μg/kg DDT in sample AGS1. Note that the same substances were detected at even higher levels in the U.S. EPA soil sample from the same location (Attachment B, Table 1). Of the analyses listed in Attachment B, Table 3, seven are above the respective RBCs. Although the RBCs are guidelines rather than absolute action levels, they should be considered in determining which sample locations deserve further action. The 16,300 μg/kg DDT in sample AGS1 is noteworthy as being more than ten times the RBC. In general it appears, from a comparison of the data, that the U.S. EPA sample results were higher than those of the START samples, although not in all cases. Original laboratory reports and the validation memorandum are presented in Attachment D.

This Letter Report completes the deliverable requirements of the TDD. If you should have any questions or require additional information, please contact our office.

Sincerely,

Larry Lueck
START Project Manager

HEALTH CONSULTATION

October 2000 Soil Sampling

ALTGELD GARDENS

CHICAGO, COOK COUNTY, ILLINOIS

EPA FACILITY ID: ILD981098395

FEBRUARY 16, 2001

Prepared by:

Illinois Department of Public Health
Under a Cooperative Agreement with the
Agency for Toxic Substances and Disease Registry

BACKGROUND AND STATEMENT OF ISSUES

The U.S. Environmental Protection Agency (USEPA) requested that the Illinois Department of Public Health (IDPH) evaluate the public health hazards posed by exposure to contaminants detected in the soil at Altgeld Gardens in Chicago, Cook County, Illinois. IDPH has written two previous health consultations for soil sampling in Altgeld Gardens; however, due to data quality issues at the Central Regional Laboratory, USEPA contracted with Ecology and Environment (E & E) to collect surface soil samples from areas previously sampled [1].

Altgeld Gardens is a Chicago Housing Authority community of about 10,000 people on the southeast side of Chicago, Illinois (Attachment 1). Altgeld Gardens covers about 190 acres and is bordered on the north by 130th Street, on the south by 134th Street and the Little Calumet River, on the west by St. Lawrence Avenue, and on the east by the Beaulien Woods Forest Preserve. This land is north and west of a wetland area and was reportedly agricultural land before Altgeld Gardens was developed in 1941 [2].

In response to community concerns, USEPA conducted a site investigation at Altgeld Gardens in 1996. IDPH evaluated that data in a November 1998 health consultation and concluded, based on the limited information available, that no apparent public health hazard existed from exposure to the surface soil contamination detected. IDPH recommended that USEPA collect more surface soil samples near the sample with the greatest pesticide levels to confirm the elevated levels found and to more fully characterize the potential exposure in the area.

In April 1999, USEPA collected twelve soil samples near apartments along 134th Street on the southern edge of Altgeld Gardens. These recent samples were collected near the location of the greatest pesticide levels detected in the 1996 site investigation. IDPH concluded that no apparent public health hazard existed from exposure to the pesticide residuals detected in surface soil at Altgeld Gardens.

Most recently, E & E collected ten surface soil samples on October 4, 2000. The samples were collected from the top 2 to 3 inches of soil (Attachment 2) and were analyzed for pesticides by a private, certified laboratory.

DISCUSSION AND CHILD HEALTH STATEMENT

IDPH compared the results of each soil sample with the appropriate screening comparison value used to select contaminants for further evaluation for carcinogenic and non-carcinogenic health effects. Chemicals found at levels greater than comparison values or those for which no comparison value exists were selected for further evaluation. A discussion of each comparison value used is found in Attachment 3. Children are a sensitive sub-population, so special consideration is given to potential exposures to children in the toxicological evaluation.

DDT, DDE, and heptachlor epoxide were found at levels greater than comparison values in three of the ten samples (Table 1); however, DDT and DDE were found at higher levels in previous sampling.

Exceeding a comparison value does not necessarily mean that exposure to the chemical will cause adverse health effects. The potential for exposed persons to experience adverse health effects depends on:

- how much of each chemical to which a person is exposed,
- how long a person is exposed, and
- the health condition of the exposed person.

Residents can be exposed to the chemicals in the soil (Attachment 4). Routes of exposure include ingestion, dermal contact, and inhalation; however, exposure to contaminated soil is limited by the grass cover at the most contaminated sample locations [2].

If a child growing up in the community or an adult living in the community were exposed to chemicals at the highest levels detected in the soil, for nine months of each year, the estimated exposure would pose no apparent increased cancer risk. The estimated low level of exposure would also not be expected to cause any non-cancer health effects [3].

CONCLUSION

IDPH concludes that, based on the information reviewed, no apparent public health hazard exists from exposure to the pesticide residuals detected in surface soil at Altgeld Gardens.

EXECUTIVE SUMMARY

GSG Consultants, Inc. (GSG) was retained by Holabird & Root LLC, to conduct a hazardous materials building survey of the units associated with the Altgeld Gardens Blocks 11, 12 & 13. The site is located at 130th Street & Ellis Avenue in Chicago, Illinois. The survey included twenty-six (26) residential buildings with a total of 244 individual units that are to be renovated as part of this project. The purpose and scope of the survey was to identify the location and quantity of asbestos containing material (ACM), lead-based paint (LBP), mold, poly-chlorinated biphenyls (PCB), and Universal Waste that may be present in these units.

GSG performed the field survey in accordance with the Illinois EPA requirements and guidelines and standard industry practices. The surveys were conducted from June 29, 2009 to July 23, 2009. The work was performed by experienced project managers and technicians who are licensed by the Illinois Department of Public Health (IDPH) and have been involved in numerous renovation projects.

Asbestos-Containing Materials (ACM)

The asbestos survey identified the presence of friable and non-friable asbestos containing materials in the building. Materials that tested positive for asbestos content include: "9x9" floor tiles & mastic, "12x12" floor tiles & mastic, pipe insulation, and associated joint compound fittings, exterior door caulk, & window caulk, roof field & flashing, and transite pipe.

Lead-Based Paint Surfaces/Components/Materials

Lead-based paint was identified on exterior wooden window and door frames. The location, component, substrate, and condition of all lead-bearing surfaces tested are listed in Sections 3, 4, 5, 6 and 7 Tables 3.2, 4.2, 5.2, 6.2, and 7.2.

All painted surfaces / components including walls and ceilings inside the units tested **Negative** for lead-based paint throughout Blocks 11, 12 and 13.

Microbial Contaminated Material (Mold)

Suspect mold growth was identified in some of the units that were inspected during this survey. Water damage was also observed in most units in Blocks 11, 12 and 13.

Polychlorinated Biphenyls (PCBs) & Universal Waste

GSG Inspectors did not observe any fluorescent light fixtures or PCB ballasts during the survey.

Chemical Waste

GSG Inspectors did not observe any chemical waste on site during the survey.

Demographic Profile

Demographic Profile of Surrounding Area (3 Miles)

This section provides demographic information regarding the community surrounding the facility. ECHO compliance data alone are not sufficient to determine whether violations at a particular facility had negative impacts on public health or the environment. Statistics are based upon the 2010 US Census and American Community Survey data, and are accurate to the extent that the facility latitude and longitude listed below are correct. The latitude and longitude are obtained from the EPA Locational Reference Table (LRT) when available.

Radius of Area:	3	Land Area:	92%	Households in Area:	35,870
Center latitude:	41.65593	Water Area:	8%	Housing Units in Area:	42,058

Re: Freedom of Information Act Request - 83654
Dear Ms. Melero:
This letter is in response to your Freedom of Information Act (FOIA) (5 ILCS 140/1 et seq.) request dated May 13, 2014 and received by the Illinois Environmental Protection Agency (Illinois EPA) on May 13, 2014.

The information responsive to your request is attached.

Requested Information
1. Chicago Park District – 939 East 132nd Street, Chicago
2. Chicago Housing Authority – 940 East 132nd Street, Chicago

Following a search, the Illinois EPA has determined there to be no information responsive to your request.

Requested Information
1. Chicago – 133373-13383 South Langley Avenue
2. Chicago – 701-755 East 133rd Pl
3. Chicago – 708-750 East 134th Street
4. Chicago – 1036-1098 East 134th Street
5. Chicago – 13314-13353 South Greenwood Avenue
6. Chicago – 13301-13355 South Dobson Avenue
7. Chicago – 1101-1147 East 131st Street
8. Chicago – 13101-13107 South Greenwood Avenue
9. Chicago – 1100-1158 East 132nd Street
10. Chicago – 13201-13263 South Greenwood Avenue
11. Chicago – 1101-1131 East 132nd Street

CITY OF CHICAGO

June 2, 2014

Nohemi Melero
Field Supervisor
Carnow Conibear & Associates, LTD.
600 West Van Buren Street
Chicago, IL 60607

Dear Ms. Melero,

This letter is in response to your Freedom of Information Act ("FOIA") request received by the Department of Fleet and Facility Management on May 19, 2014 where you seek and state the following:

We are sending this Freedom of Information request regarding the existence of any record of hazardous materials incident reports and other records of environmental concern, for the following property in Chicago, Illinois:

- ***Altgeld Gardens Housing Project***

Your request has been reviewed and has been granted please see the attached documents for the above mentioned property in our files maintained by the Department of Fleet and Facility Management (2FM).

Sincerely,

Yasmine S. Miranda
FOIA Officer
Department of Fleet and Facility Management

Subject: Residential Soil Sampling Results

Dear Mr. Moomey:

Enclosed please find the residential soil sampling results for the Eden Green Cooperative, Concordia Park Apartments, Altgeld Gardens public housing development, 12 residences, and two schools sampled by Black & Veatch Waste Science, Inc. as part of an expanded site inspection.

To assist you with the analytical results, this package includes a sample reporting form preceding each set of raw data. For the residences, the form lists the name and address of the resident where each sample was taken. For the other properties, the form lists the name and address of a contact person, as well as a brief description of the sample location. The U.S. Environmental Protection Agency sample number listed on the form corresponds to the number on the upper right hand corner of the raw data sheet. Also listed is the name of the site associated with the sampling effort. The package also includes a sample location map and definitions for the organic and inorganic chemical data qualifiers.

If you have any questions, please do not hesitate to contact us.

Sincerely,

BLACK & VEATCH WASTE SCIENCE, INC.

SMrkvicka

RE: Residential Soil Sample Results Interpretation

Dear Ms. Rowder:

The Department has received and reviewed the laboratory data provided by Black & Veatch Waste Science Inc. for the soil sample taken at Altgeld Gardens Public Housing. It is our role in this matter to comment on the potential health effects posed by exposure to this soil.

The results of the soil analyses for both organic and inorganic parameters indicate no occurrence of any compounds at levels exceeding current health standards or guidelines, except for two semi-volatile organic compounds named benzo(a)pyrene and chrysene. Benzo(a)pyrene and chrysene belong to a group of chemicals called polycyclic aromatic hydrocarbons (PAHs). PAHs are formed during the incomplete burning of coal, oil, gas, wood, garbage, or other organic substances, such as tobacco and charbroiled meat. PAHs enter the environment largely as releases to air from volcanoes, forest fires, residential wood burning, and automobile and truck exhausts. PAHs can be found virtually in all soils everywhere.

The laboratory results indicated that benzo(a)pyrene and chrysene were found in the soil sample collected from a courtyard at a level of 9,000 and 12,000 parts per billion (ppb) respectively. These levels are above the upper limits of the national urban background soil concentrations of 220 ppb for benzo(a)pyrene and 640 ppb for chrysene (see attached table). The table indicates the concentrations of PAHs commonly found in rural, agricultural, and urban soils.

The above mentioned results may be indicative of a single isolated incident at the sample site (ex. past use for wood burning, emptying charcoal ashes, etc.), since these compounds were only found at these levels in the soil sample taken from the courtyard. Although, the Environmental Protection Agency (EPA) has determined that benzo(a)pyrene and chrysene are probable human carcinogens, we see no apparent health concerns related to normal exposure to soil at this property.

The primary routes of PAH exposure from the soil are ingestion of dust, inhalation of dust, and dermal (skin) absorption. You may want to minimize possible exposure to PAHs by providing and maintaining a vegetative cover (ex. grass, flowers, etc.) on the soil.

If you have any questions or concerns, please contact me at the Division of Environmental Health, Toxicology Section, 525 West Jefferson Street, Springfield, IL 62671 or call 217/782-5830.

Sincerely,

Monica J. Rebbe

MEMORANDUM

TO: Alan Altur

FROM: Monica Rebbe

DATE: October 12, 1994

RE: Residential Soil Samples
Pullman Factory

For your review, please find enclosed the letters for the individuals or properties where the soil samples were taken. There were eight locations which indicated no occurrence of any compounds at levels exceeding current health standards or guidelines. Based on these results, we saw no apparent health concerns related to normal exposure to the soil at those locations.

There were nine locations with results indicating levels of benzo(a)pyrene higher than national norms. These levels were not of the magnitude to cause concern for health, but we suggested to maintain a vegetative cover on the soil to reduce exposure.

The Altgeld Gardens Public Housing sample results indicated no occurrence of compounds exceeding current health standards and guidelines, except for the sample taken in the courtyard. The results indicated high levels of polycyclic aromatic hydrocarbons (PAHs). The two of most concern are benzo(a)pyrene and chrysene. After completing a risk characterization for a child exposed to the levels reported, no apparent increased risk of cancer was found. The high levels of PAHs in this one sample may also be indicative of a single isolated incident, such as wood burning or emptied charcoal ashes at the soil sample site.

Please note the Altgeld letter states that a carbon copy will be sent to Ms. Cheryl Johnson. Since we sent the letters to you to forward, please don't forget to send the carbon copy.

If you have any questions, please contact Mike Moomey or me at (217) 782-5830.

**SUBJECT: RESIDENTIAL SOIL SAMPLE RESULTS
CHICAGO HOUSING AUTHORITY
ALTGELD GARDENS DEVELOPMENT, IL2-07**

Dear Ms. Rebbe:

We wish to thank you for your letter of February 23, 1995 to Ms. Michael Rowder of the Chicago Housing Authority (CHA), copy attached. This letter interprets the laboratory results of a soil sample taken at Altgeld Gardens by Black & Veatch Waste Science, Inc.

The above mentioned letter explains that the laboratory results of the sample show that the organic and inorganic parameters indicate no occurrence of any compounds at levels exceeding current health standards or guidelines, with the exception for two semi-volatile organic compounds. These two compounds: Benzo(a)pyrene and chrysene belong to a group of chemicals called polycyclic aromatic hydrocarbons (PAHs). Furthermore, as stated these PAHs are formed by the incomplete burning of coal, oil, gas, or other organic substances such as tobacco and charbroiled meat; and may be found everywhere.

As stated in your letter the results may be indicative of a single isolated incident at the sample site since these PAHs were only found at the high levels in the soil sample taken from the courtyard.

Therefore, the Authority is confirming its understanding that no action is required of the CHA, based on the Illinois Department of Public Health's interpretation of the results. Your recommendation regarding vegetative cover will be forwarded to the development management staff for their review and implementation pending availability of funds for this purpose.

Again, we thank you for the testing performed and the interpretation of the results for the benefit of CHA residents at Altgeld Gardens.

If you have any questions or require additional information, please contact Michael Rowder, Manager Environmental Unit at (312) 567-7775 Extension 1074 or Nestor P. Ardiente, Senior Environmental Officer, Environmental Unit at Extension 1076.

Sincerely,

Andrew Rodriguez
Director of Construction Management

RE: Residential Soil Sample Results Interpretation

Dear Ms. Rowder:

The Department has received and reviewed the laboratory data provided by Black & Veatch Waste Science Inc. for the soil sample taken at Altgeld Gardens Public Housing. It is our role in this matter to comment on the potential health effects posed by exposure to this soil.

The results of the soil analyses for both organic and inorganic parameters indicate no occurrence of any compounds at levels exceeding current health standards or guidelines, except for two semi-volatile organic compounds named benzo(a)pyrene and chrysene. Benzo(a)pyrene and chrysene belong to a group of chemicals called polycyclic aromatic hydrocarbons (PAHs). PAHs are formed during the incomplete burning of coal, oil, gas, wood, garbage, or other organic substances, such as tobacco and charbroiled meat. PAHs enter the environment largely as releases to air from volcanoes, forest fires, residential wood burning, and automobile and truck exhausts. PAHs can be found virtually in all soils everywhere.

The laboratory results indicated that benzo(a)pyrene and chrysene were found in the soil sample collected from a courtyard at a level of 9,000 and 12,000 parts per billion (ppb) respectively. These levels are above the upper limits of the national urban background soil concentrations of 220 ppb for benzo(a)pyrene and 640 ppb for chrysene (see attached table). The table indicates the concentrations of PAHs commonly found in rural, agricultural, and urban soils.

The above mentioned results may be indicative of a single isolated incident at the sample site (ex. past use for wood burning, emptying charcoal ashes, etc.), since these compounds were only found at these levels in the soil sample taken from the courtyard. Although, the Environmental Protection Agency (EPA) has determined that benzo(a)pyrene and chrysene are probable human carcinogens, we see no apparent health concerns related to normal exposure to soil at this property.

Printed on Recycled Paper

The primary routes of PAH exposure from the soil are ingestion of dust, inhalation of dust, and dermal (skin) absorption. You may want to minimize possible exposure to PAHs by providing and maintaining a vegetative cover (ex. grass, flowers, etc.) on the soil.

If you have any questions or concerns, please contact me at the Division of Environmental Health, Toxicology Section, 525 West Jefferson Street, Springfield, IL 62671 or call 217/782-5830.

Sincerely,

Monica J. Rebbe

REPLY TO THE ATTENTION OF:

MAR 07 1995

S-14J

Hazel Johnson, Director
People for Community Recovery
13116 South Ellis Avenue
Chicago, Illinois 60627

Dear Mrs. Johnson:

I want to share with you information on a recent U.S. Environmental Protection Agency (EPA) investigation at the former Pullman Factory site. The Pullman Expanded Site Investigation (ESI) is complete and attached is a copy of the finished report. In conjunction with the investigation, the Illinois Department of Public Health (IDPH) analyzed a number of soil samples from the nearby community. In fact, three of those samples were taken from Altgeld Gardens.

The ESI was conducted to determine whether this site qualifies for the National Priorities List (NPL) of hazardous waste sites under EPA's Superfund program. The results of the soil analyses for both organic and inorganic parameters indicate only two compounds occurring at levels exceeding current health standards or guidelines. These two semi-volatile organic compounds are benzo(a) pyrene and chrysene which belong to a group of chemicals called polycyclic aromatic hydrocarbons (PAHs). PAHs are formed during the incomplete burning of coal, oil, gas, wood, garbage, or other organic substances, such as tobacco and charbroiled meat. PAHs enter the environment largely as releases to air from residential wood burning, and automobile and truck exhausts. PAHs are found virtually in all soils everywhere.

The laboratory results indicate these compounds were found in the soil sample collected from the Altgeld Gardens courtyard sampling location, at the level of 9,000 and 12,000 parts per billion (ppb) respectively. These levels are above the upper limits of the national urban background soil concentrations of 220 ppb for benzo(a)pyrene and 640 ppb for chrysene.

These results may indicate a single isolated incident at the sample site (e.g., past use for wood burning or emptying charcoal ashes) since these compounds were only found at these levels in the soil sample taken from the courtyard. Based on these findings there are no health concerns related to normal exposure to soil at Altgeld

Gardens. However, your familiarity with the location can provide me with valuable insights about the potential causes and I would like to meet with you to discuss your thoughts about the source. I know you are as interested as I in pursuing whatever avenues might be useful in protecting the public health in Southeast Chicago and I look forward to such a meeting.

Please call either Shirley Dorsey of my staff at 886-1770 or Ethel Crisp at 353-3808 to arrange a convenient meeting date and time for us to talk further.

Sincerely,

Corinne S. Wellish

Sampling Activity I
(wipe samples)

On March 19,1996, the United States Environmental Protection Agency (U.S. EPA) received the results from seven wipe samples collected by U.S. EPA and the Illinois Environmental Protection Agency (IEPA) on March 8th. Analysis was performed by IEPA's lab in Springfield. All sample results were below the reporting value of 1 microgram(ug)/wipe. Standard wipe samples are taken over a 100 cm^2 area. The results are as follows:

Sample #	Result	Location
D602786	0.22 ug/100 cm^2 (est. value)	floor just inside doors to Gautreax Child/Parent Center
D602787	0.45 ug/100 cm^2 (est. value)	sidewalk outside doors to Gautreax Center
D602788	< 1 ug/100 cm^2	floor inside lobby of Garden Fast Food
D602789	0.46 ug/100 cm^2 (est. value)	asphalt outside door to Garden Fast Food
D602790	< 1 ug/100 cm^2	kitchen floor in front of fire door at Garden Fast Food
D602791	< 1 ug/100 cm^2	floor inside library doors
D602792	< 1 ug/100 cm^2	sidewalk outside library doors

These results have been reported to the Gautreax Center, Garden Fast Food, Altgeld Branch Library, CHA, Local Advisory Counsel (LAC), and People for Community Recovery (PCR). The results are below the U.S. EPA's residential cleanup standard and the Illinois Public Health Department's standard for cleanup of PCBs in schools on surfaces contaminated by releases from PCB light ballast, both of which have a cleanup standard of 10 ug/100 cm^2.

Sample results are attached.

Laboratory #: ME9908059

These samples were wipe samples. They were extracted by sonication and analyzed by Method SW 846-8082 for PCBs by GC/ECD analysis.

This samples were received on 8/6/99. They were extracted on 8/17/99 and analyzed the following day.

The action level for these samples was 1 ug/wipe. Sample extraction parameters were established to obtain a sample concentration of 0.1 to 2 ug/wipe. The two LCS's associated with these samples were spiked with AR1016/1260, at a level of 1 ug/wipe. The concentration of AR1260 was quantitated and reported The recovery was 89% for each LCS Because the samples were wipes, a MS/MSD could not be done.

The samples, MB and LCS's were all spiked with two surrogates. All recoveries for all samples were within QC limits

All standards associated with these samples met Method 8082 criteria The laboratory runs initial calibration standards for all PCBs from AR1016 thru AR1260. The raw data from AR1016/1260 and AR1242 initial linearity standards are included in this data package

Although there were peaks detected in the elution range of some PCBs, no Arochlor pattern was detected, so no PCB results were quantitated for either sample

The samples had sulfur, florisil and acid clean-ups

PHASE I ENVIRONMENTAL SITE ASSESSMENT

Conducted on:

CHICAGO YOUTH GAUTREAUX CENTER
975 East 132 Street
Chicago, Illinois

CARNOW, CONIBEAR & ASSOC., LTD.
Occupational and Environmental Health Consultants
333 West Wacker Drive, Suite 1400, Chicago, IL 60606, 312/782-4486

Chicago Youth Gautreaux Center
975/945 E. 132nd Street
Phase I/II Environmental Site Assessments

Phase I Environmental Site Assessment - March 26, 1999

Missing or Limited Information:

1. Aerial Photographs not included as part of Phase I ESA
2. No receipt of FOIA responses, addendum to be submitted if warranted
3. No legal description of the property provided
4. Mention of construction site to the north - no description of activities, unlabeled warehouse per Sanborn map
5. One Sanborn map from 1975 was available, 50 yr. historical review required per ASTM
6. Limited description and information on uses of surrounding properties
7. Site map provided does not include surrounding area description, structures, etc.
8. Groundwater flow not described in water resources
9. No linking of photos taken and description of site
10. UST at 939 E. 132nd St, greater than 200 ft., therefore no impact ??
11. ACM present at site - boiler insulation, floor tiles, etc.
12. LBP potential presence based on age of structure
13. Transformers and PCB identifies light ballasts. Transformers not found during site visit, however a transformer picture is included in the appendix.
14. Database search indicates - USTs at 939 and 940 E. 132nd St. (DOE), and listed sites from independent search include UST at 939 E. 132nd St., and CHA Altgeld Gardens at 940 E. 132nd St. with an EPA ID: ILD981098395 and civil judicial and administrative enforcement case. Sites determined to be of minimal environmental concern based on close proximity. 34 orphan sites were determined to be of no environmental concern due to location. No copy of the database was provided

Conclusions.

1. USTs in close proximity
2. LBP due to age of building
3. ACM due to age of building
4. PCBs in fluorescent light ballasts

Does not address the potential impacts of surrounding properties due in part to limited historical/current information contained in the Phase I ESA.

Chicago Youth Gautreaux Center
975/945 E. 132nd Street
Phase I/II Environmental Site Assessments

Phase II Environmental Site Assessment

Objectives: Impact of USTs
LBP Survey
Asbestos Survey

Missing or Limited Information:

1. Site location description is limited to streets adjacent to the site. No description of the property to the north
2. Conclusions cited from the Phase I ESA are not consistent, missing PCB light ballasts
3. No BTEX comparison to regulations included in Table 1 results. Limited PNA constituents included in Table 1.
4. B-3 sample collected at 9-10 ft. bgs at PID = 24.6, however sample at 0-3 ft. bgs at PID = 46.44
5. No asbestos sampling around water heater which was an area of concern in the Phase I ESA.

Soil Investigation

5 samples taken from northern and northwestern portion of property. Tier 1 SROs not exceeded for the constituents analyzed. Note inconsistency at B-3.

Asbestos Survey

Non-friable ACM encountered in approximately 5500 sq. ft. between the gym and the office. Materials in good condition and should not pose an environmental concern to occupants.

LBP

None of the locations tested indicated the presence of LBP.

Conclusions

Soils samples indicated that the site has not been adversely impacted by neighboring USTs.
Estimated 5500 sq. ft. of non-friable ACM which should not pose an environmental concern.
No LBP was identified during sampling.
CCA does not recommend performing additional investigation or abatement work at the site.

DOE Concerns

Limited historical information of surrounding properties (not compliant with ASTM).
Limited information included about the property to the north.
Database results not included as part of the Phase 1 ESA.
No PCB sampling included at the site.
Presence of ACM for future demolition/remodeling activities.

1.0 Executive Summary

This report presents the results of the Carnow, Conibear & Assoc., Ltd. (CCA) investigation associated with a Phase I Environmental Site Assessment (ESA) for the Chicago Youth Gautreaux Center, the property. The property is located at 975 East 132nd Street, Chicago, IL 60608. The Phase I ESA consisted of a visual site inspection, a site historical review, a review of public record documents, an interview with the building engineer, and a review of government agency records.

The property encompasses a total area of approximately 9800 square feet consisting of a one-story building. The building was constructed in 1978. The City of Chicago Department of Human Services utilizes the building as a child development center. The property has been the Gautreaux Center since 1978, and prior to that it was vacant land.

The Phase I ESA discovered several areas of environmental concern. These areas include the following; 1) potential presence of soil contamination associated with the former presence of two (2) USTs on the adjacent property; 2) the potential presence of friable and non-friable asbestos containing materials in the building; 3) the potential presence of lead-based paints (LBPs) in the building; and 4) The potential presence of PCBs in the fluorescent light fixtures located throughout the entire building and the pole-mounted transformers located on the north side of the property.

CCA recommends the following: 1) conduct a surface and subsurface soil investigation to determine if site has been adversely impacted by the presence of the tanks; 2) conduct a comprehensive asbestos bulk survey to determine the extent and condition of ACMs present on the property; 3) conduct a lead-based paint survey for the building; and 4) monitor the condition of the fluorescent ballasts for any signs of leaking. If noticed, then the ballasts should be replaced and disposed of in accordance with all state and federal regulations when any renovation or demolition occurs.

2.0 Introduction

The City of Chicago Department of Environment (CDOE) retained Carnow, Conibear & Assoc., Ltd (CCA) to perform a Phase I ESA for the Chicago Youth Gautreaux Center. The property is located at 975 East 132nd Street. The Phase I ESA was performed in accordance with the current American Society of Testing Materials (ASTM) Standards Practices of Environmental Assessment, E 1527-97. The following activities were conducted:

- An interview with the building engineer
- Review of topographic, floodplain, wetlands, and Sanborn Fire Insurance maps
- Review of government/public access records
- Review of local, state and Federal databases
- Visual investigation of adjacent properties

2.1 OBJECTIVE

The objective of the Phase I ESA was to obtain and evaluate information related to recognized environmental conditions of the property.

2.2 LIMITATIONS AND EXCEPTIONS

With respect to ASTM standard, there were limitations associated with this Phase I ESA. Aerial photographs were not available for the property, and responses to the FOIA requests have not been received from some of the government agencies. CCA will issue an addendum to this report upon receiving all the FOIA requests, if warranted.

3.0 Site Overview

3.1 Location

The subject property is located at 975 East 132nd Street, Chicago, Illinois, Section 34, Range 14 East, Township 37 North (Exhibit I). The property is zoned R3, General Residential. All of the surrounding properties are also zoned R3, with the exception of the properties located to the west, which are zoned B4-1, Restricted Service (Exhibit III). The property is bordered by: South Ellis Avenue and residential property on the east; West 132nd Street , a church, and a neighborhood clinic on the south; a public alley and a branch of the Chicago Public Library to the west; and a construction site to the north.

3.2 Current Use

The property is currently used as a Head Start child development center.

4.0 Site Background/ Operating History

4.1 Current Ownership

According to information found on the property, the owner is the City of Chicago Department of Human Services.

4.2 Prior Ownership

A real title search including any deeds, easements, leases, restrictions, and covenants for a period of fifty years was not provided to CCA. However, a title search is not required by ASTM if other historical sources of information provide the necessary information. CCA feels that the data collected during the Phase I ESA provided sufficient information about the subject property which eliminated the need for a fifty year title search. The site was vacant until the current building was constructed in 1978.

4.3 Utility Services

The following utility service companies are currently in use or available to the property:

- Natural Gas - People's Gas;
- Potable Water- City of Chicago;
- Storm & Sanitary Sewer - City of Chicago; and
- Electricity - Commonwealth Edison.

4.4 Aerial Photographs

Aerial photographs were not available for the site.

4.5 Sanborn Fire Insurance Maps

CCA performed a search for reasonably ascertainable Sanborn Fire Insurance Maps for the subject property. One (1) Map was discovered for the year 1975. The map shows the property as being vacant.

Historic uses of adjacent properties were also reviewed as part of the assessment. The Map shows all of the surrounding properties to resemble those that were seen on the day of the site visit, except the property to the north. The Map shows a warehouse located on that site.

5.0 Environmental Setting

5.1 Surface Water Characteristics

The topography of the property region is relatively flat. Elevations in the vicinity of the site are 590 feet above mean sea level, according to the United States Geological Survey 7.5- minute topographic quadrangle for the Lake Calumet, Illinois-Indiana, (dated 1963, photorevised 1973 and 1977). The ground surface at the site appears flat. Surface and storm water flow toward the storm water sewers along the edge of the streets.

The Federal Emergency Management Agency (FEMA) has designated the property as Zone C, which means that it is an area of minimal flooding (Community Panel 170074-0120B, June 1981). Additionally, there are no wetlands on the property, but there are three (3) within 1/2 mile of the property, Lake Calumet located one mile north, and the Little Calumet River located less than one mile to the south. The wetlands are: PEMF (Palustrine Emergent Semi-permanently Flooded); PSS1C (Palustrine Scrub-Shrub Broad-Leafed Deciduous Seasonally Flooded) on the west; and P(FO1/EM)Ad (Palustrine Forested Broad-Leafed Deciduous above Emergent Temporarily flooded partially drained/ditched) on the south (National Wetlands Inventory Map, Lake Calumet, IL-IN, June, 1983).

5.2 Subsurface Geological Characteristics

The property is located in the Dolton Member of the Equality Formation, which is composed of sand, silt, and clay deposits that accumulated in glacial lakes. The surficial geology of the area is characterized as unconsolidated glacial deposits consisting of quiet-water lake sediments, dominantly well bedded silt with interbedded clay and sand overlying clay till, all of which is overlain by various fill materials. A very stiff gray silty clay (hardpan) clayey sand and gravel underlies the Wadsworth. These till units represent earlier stages of glacier advancement and retreat, and most likely belong to the Wadsworth Member or the Yorkville Till Member of the Wedron Formation. The soils in this area are classified as "C1," sand and gravel less than 20 feet thick over relatively impermeable till or bedrock, or "D2," uniform, impermeable sandy till, at least 20' thick.

Bedrock, which directly underlies the till, is the Racine Formation of the Silurian Nigerian Series. The bedrock is typically composed of gray to white, medium grained, pure to slightly argillaceous, fossilferous dolomite. Typically, the upper portion of the dolomite bedrock is fractured, and has increased porosity and permeability.

5.3 Groundwater Characteristics

Groundwater in the vicinity of the site ranges in depth from approximately 20 feet to 60 feet below ground surface. No groundwater investigation data for the subject site or immediately adjacent properties was available. Therefore, CCA was unable to determine groundwater flow direction for the subject site.

Two (2) primary aquifers are present in the Chicago region, the shallow dolomite aquifer which includes the bedrock strata directly underlying the unconsolidated glacial sediments, and the (deep) Cambrian-Ordovician Aquifer, which mostly consists of sandstone and is isolated from the shallow dolomite aquifer by up to 250 feet of shale. Glacial aquifers are also present in the Chicago region in the form of lacustrine sands (Dolton Member) and outwash sand and gravel (Henry and Wedron Formation).

6.0 Site Inspection

6.1 Site Observations and Inquiries

The site reconnaissance was performed on March 22, 1999 by Ted Cagney of CCA. The building engineer, Mr. James Edwards accompanied CCA during the reconnaissance. The site reconnaissance consisted of a walk around the property grounds, a visual inspection of the interior of the building, and a visual investigation of the adjacent properties accessible to the general public. Photographs taken during the site visit are presented in Appendix A. Exhibit II presents the site map.

The site consists of a brick and concrete block main building, a chain-link fence enclosed playground, and a parking area. The playground is located to the south of the building, and the parking lot to the east. The building is of brick and concrete block construction, and has no basement. The building is divided into several areas by their use - offices, a classroom, a kitchen and dining area, storage closets, a utility closet, and a laundry room. Fluorescent lighting is used throughout the facility. The floors in the classroom, the dining area, and the offices are carpeted, with the rest of the halls having tiled floors. The ceilings have 1' x 1' acoustical ceiling tiles. The paint on the walls was in good condition.

The boiler room is located off the dining area, and contains a hot water heater and piping with insulation which may have asbestos.

6.2 Area Reconnaissance

Adjacent properties with contiguous property lines, were visually inspected from vantage points available to the general public. The property is bordered by the following properties:

- North: a construction site;
- East: South Ellis Avenue and residential property;
- South: East 132nd Place, a health clinic, a church, and residential property; and
- West: a public alley, and a branch of the Chicago Public Library.

6.3 Hazardous Substances and/or Chemical Storage

On May 19, 1980, the EPA published in the Federal Register the first phase of the Resource Conservation and Recovery Act (RCRA), 1980 RCRA Laws. RCRA defines a hazardous waste as a solid waste that may cause or significantly contribute to serious illness or death, or that poses a substantial threat to human health or the environment when improperly managed. The only chemicals that are located on the property are commercial cleaning products that are used to clean the facility. These chemicals are kept in rooms that remain locked at all times. The only keys for these rooms are with the building engineer, and in the main office.

6.4 Waste Disposal

Waste currently generated at the site consists of municipal wastes, which includes rubbish, and cardboard. Disposal is by National Waste Removal.

6.5 AST/UST Systems and Pipelines

6.5.1 On-site

According to Mr. Edwards, there are no Underground Storage Tanks (USTs) located on the property.

No aboveground storage tanks (ASTs) were noted at the time of our site reconnaissance.

6.5.2 Adjacent Properties

No obvious ASTs were observed on the immediately adjacent properties to the site. However, not all portions of the adjacent properties were visible to the public.

There is one (1) UST site located within 1/8 mile of the property, at 939 East 132nd Street. Given the fact that the site is closed and that the UST site is greater than 200 feet from the subject property, it is not an environmental concern to the property.

6.6 Asbestos Containing Materials (ACMs)

Based on the age of the building, there is a potential that ACMs are present in the building. Several suspected ACMs were identified during the site inspection. These include ceiling tile, pipe insulation, and hot water tank insulation.

6.7 Lead-Based Paint

In 1973, the Consumer Product Safety Commission (CPSC) established a maximum lead content in paint of 0.5% by weight of dry film of paint newly applied. In 1978, CPSC lowered the allowable lead level in paint to 0.06%. Based the age of the building, there is the possibility that LBPs are present. On the day of the site visit, the paint on the walls was in good condition and not peeling.

6.8 Transformers and PCB Equipment

The Toxic Substance Control Act (TSCA) of 1976 mandates the regulation of electrical transformers containing a toxic substance known as polychlorinated biphenyl (PCB). Prior to 1976, PCB transformers were manufactured and placed into service by various electric utility companies without government regulation. Regulations promulgated under TSCA require that transformers containing PCBs be marked as such. Subsequently, a PCB Ban Rule was enacted in 1979 to eliminate the use of PCBs in transformers. No transformers were observed on the day of the site visit.

Fluorescent lights were observed throughout the facility. They appeared to be in good condition.

6.9 Site Plan Drawing

CCA was provided a site plan. Exhibit II, Site Plan, shows a detailed layout of the property.

7.0 Environmental/Regulatory Agency Inquiries

This section presents the results of the government agency Freedom of Information Act (FOIA) responses and the government agency database search that was performed by EDR in accordance with the ASTM standard.

7.1 Federal and State Regulatory Agencies

FOIA requests were sent to the USEPA, the OSFM, and the IEPA for any violations, permits, reports of land, air or water pollution, and/or UST and AST information on file for the property. As of the date of issue of this report, no responses to the FOIA requests have been received. After they are received, they will be reviewed, and CCA will issue an addendum, if warranted.

7.2 Local Governmental Agencies FOIA

A Freedom of Information Act (FOIA) request was sent to the City of Chicago Department of Environment (CDOE). The CDOE had no information for the site, but had the following information for the adjacent properties:

939 E. 132nd Street:
- 8/21/95: Permit to remove one (1) 5,000 gallon UST, former contents unknown
- 9/12/95: Permit to abandon in place one (1) 5,000 gallon gasoline UST.

940 E. 132nd Street
- 12/2/60: Install one (1) 1,000 gallon gasoline UST

Copies of the requests and responses can be found in Appendix B.

7.3 Regulatory Database Inquiry

CCA retained Environmental Data Resources (EDR) of Southport, Connecticut to conduct a search of available environmental databases for the property and surrounding properties. The databases were searched according to ASTM standards. The descriptions, sources, telephone numbers, government version dates, and definitions for each of the databases are provided in Appendix C. Databases marked with an asterisk were not required to be searched by ASTM standards and were searched only for the target property. The center of the site was used as the target property.

- National Priority List (NPL)
- Comprehensive Environmental Response and Liability Information System (CERCLIS)
- Comprehensive Environmental Response and Liability Information System (CERC-NFRAP)
- Resource Conservation Recovery Act Information System (RCRIS)-Large Quantity Generator (LQG)
- RCRIS- Small Quantity Generator (SQG)
- Facility Index System (FINDS)
- Emergency Response Notification System (ERNS)
- Illinois LUST Incident Report (LUST)
- Illinois OSFM UST Database (UST)
- Toxic Chemical Release Inventory System (TRIS)
- Solid Waste Facilities/Landfill Sites (SWF/LS)
- Hazardous Waste Sites (SHWS)
- State Priority or Superfund List (SPL)
- Superfund (CERCLA) Consent Decrees (CONSENT) State Landfill*
- Corrective Action Report (CORRACTS)*
- Hazardous Materials Information Reporting System (HMIRS)*
- Material Licensing Tracking System (MLTS)*
- Federal Superfund Liens (NPL LEINS)*
- PCB Activity Database System (PADS)*
- RCRA Administrative Action Tracking System (RAATS)*
- Records of Decision (ROD)*
- Toxic Substances Control Act (TSCA)*, and
- Coal Gas.*

There are two (2) properties located within a quarter-mile radius of the site. One of the properties is listed in multiple databases. Sites listed in databases include: one (1) UST site; one (1) RCRIS-SQG site and one (1) FINDS site. Table 1 (below) includes the sites listed within a half-mile radius of the property. All sites are in the City of Chicago, IL, unless specified otherwise.

TABLE 1
Listed Sites for Surrounding Properties Within 1/2 Mile of Site

Distance from Property	Owner/Address	Listed Database	Comments
< 1/8 Mile WNW	Chicago Park District 939 E. 132nd Street Chicago, IL	UST	Facility ID: 2-030903 Total Tanks: 0 Status: Closed
< 1/8 Mile WNW	CHA Altgeld Gardens 940 E. 132nd Street	RCRIS-SQG FINDS	EPA ID: ILD981098395 No violations reported Civil judicial and administrative enforcement case against facility (under DOCKET)
1/4 -1 /2 Mile NE	Calumet Nu Earth 130th/DOTY	Planning Commission	
1/4 -1 /2 Mile NE	Chicago Metro Sanitary District #3	Planning Commission	
1/4 -1 /2 Mile NE	Chicago Metro Sanitary District #2	Planning Commission	
1/4 -1 /2 Mile NE	Chicago Metro Sanitary District #4	Planning Commission	

There is minimal environmental concerns associated with the Park District LUST and the CHA Altgeld Gardens sites due to their close proximity to the property.

7.4 Orphan Sites

There were thirty four (34) orphan sites, or listed sites that could not be mapped due to poor or inadequate address information, identified during the database search. CCA was able to eliminate these sites as being outside of a 1/8 mile radius from the subject property and therefore not an environmental concern to the property.

8.0 Summary and Conclusions

CCA performed a Phase I Environmental Site Assessment, in conformance with the scope and limitations ASTM Practice E 1527-97, of 975 East 132nd Street, the property. Any exceptions to, or deletions from, the practice are described in Section 2.2 of this report. This assessment has revealed no evidence of recognized environmental conditions in connection with the property except for the following:

- **Underground Storage Tanks (USTs).** The property located at 939 East 132nd Street formerly contained two (2) gasoline USTs. The tanks were removed in 1995 and 1996. There is no information regarding the regulatory status of the USTs. CCA recommends performing subsurface soil investigation to determine if the site has been adversely impacted by the adjacent property.

- **Lead-Based Paints (LBPs).** Due to the age of the building, there is the potential for LBPs to be present in the building. CCA recommends that a LBP survey be conducted to determine if they are present in the building.

- **Suspected Asbestos Containing Materials.** Based on the age of the building, there is the potential for ACMs to be present in the building. Suspected ACMs include pipe insulation, hot water heater, and ceiling tiles. CCA recommends performing a comprehensive bulk asbestos survey to determine the extent and condition of ACMs present on the property.

- **Fluorescent Light Ballasts**. Due to the age of the building, and the presence of fluorescent light fixtures throughout the facility, PCBs are suspected to be present. No labels were observed on these fixtures. CCA did not notice any signs of leaking or staining of the fixtures. CCA recommends monitoring the condition of the fluorescent ballasts for any signs of leaking. If noticed, then the ballasts should be replaced and disposed of in accordance with all state and federal regulations when any renovation or demolition occurs.

CCA has applied prevailing industry standards and reasonable judgment and effort within the scope of work outlined in CCA's proposal, while conducting the Phase I ESA. The standards, judgment, and effort used by CCA personnel to investigate, assess, and determine the presence of potential environmental hazards and liabilities associated with the property are consistent with the requirements outlined the current ASTM Standards N°. E1527.97. CCA makes no warranty, express or implied, that the findings and interpretations in this report are a complete representation of the environmental hazards and liabilities, associated with the property. There may be unrecorded information or documentation from previous owners or tenants that is unattainable and may be proprietary, legally protected, or unavailable through government regulatory services.

333 West Wacker Drive, Suite 1400, Chicago, IL 60606, 312/782-4486

March 23, 1999

Ms. Cassandra Curry
City of Chicago, Department of Environment
30 North LaSalle, 25th Floor
Chicago, IL 60602

Dear Ms. Curry:

We are sending this Freedom of Information request regarding the existence of any record of air, water or land pollution complaints regarding the following properties:

Abraham Lincoln Near South Center
4210 S. Berkeley
Chicago IL 60653

Boys & Girls Club- Fletcher Center
3140 W. Ogden
Chicago IL 60623

Trinity United - Brooks Center
6921 S. Stony Island
Chicago IL 60649

Chicago Youth Gautreaux Center
975 E 132nd St.
Chicago IL 60627

YMCA Garfield Center
7 N. Homan
Chicago IL 60624

We would appreciate receiving information about citizen complaints, violations, citations, emergency response to spills, underground storage tanks, aboveground storage tanks, or other such information concerning the above referenced properties. Our fax number is (312) 782-5145.

If you find any documents on file, we would appreciate it if you would forward this information to us as soon as possible. If you have any questions, please call me at (312) 782-4486 ex308.

Sincerely,
CARNOW, CONIBEAR & ASSOC, LTD.

Erin Menig

Erin Menig
Geologist

Database Definitions

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Elapsed ASTM days: Provides confirmation that this EDR report meets or exceeds the 90-day updating requirement of the ASTM standard.

FEDERAL ASTM RECORDS:

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System
Source: EPA
Telephone: 703-413-0223
CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Date of Government Version: 11/10/98
Date Made Active at EDR: 01/29/99
Database Release Frequency: Quarterly

Date of Data Arrival at EDR: 12/29/98
Elapsed ASTM days: 31
Date of Last EDR Contact: 03/03/99

ERNS: Emergency Response Notification System
Source: EPA/NTIS
Telephone: 202-260-2342
Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.

Date of Government Version: 12/31/98
Date Made Active at EDR: 01/18/99
Database Release Frequency: Quarterly

Date of Data Arrival at EDR: 01/13/99
Elapsed ASTM days: 5
Date of Last EDR Contact: 01/04/99

NPL: National Priority List
Source: EPA
Telephone: 703-603-8852
National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC).

Date of Government Version: 01/19/99
Date Made Active at EDR: 02/19/99
Database Release Frequency: Semi-Annually

Date of Data Arrival at EDR: 02/08/99
Elapsed ASTM days: 11
Date of Last EDR Contact: 02/08/99

RCRIS: Resource Conservation and Recovery Information System
Source: EPA/NTIS
Telephone: 800-424-9346
Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA).

Date of Government Version: 10/01/98
Date Made Active at EDR: 01/29/99
Database Release Frequency: Semi-Annually

Date of Data Arrival at EDR: 12/28/98
Elapsed ASTM days: 32
Date of Last EDR Contact: 01/25/99

CORRACTS: Corrective Action Report
Source: EPA
Telephone: 800-424-9346
CORRACTS identifies hazardous waste handlers with RCRA corrective action activity.

Date of Government Version: 12/01/98
Date Made Active at EDR: 01/29/99
Database Release Frequency: Semi-Annually

Date of Data Arrival at EDR: 12/28/98
Elapsed ASTM days: 32
Date of Last EDR Contact: 12/22/98

FEDERAL NON-ASTM RECORDS:

BRS: Biennial Reporting System
Source: EPA/NTIS
Telephone: 800-424-9346
The Biennial Reporting System is a national system administered by the EPA that collects data on the generation and management of hazardous waste. BRS captures detailed data from two groups: Large Quantity Generators (LQG) and Treatment, Storage, and Disposal Facilities.

Date of Government Version: 12/31/95
Database Release Frequency: Biennially
Date of Last EDR Contact: 12/21/98
Date of Next Scheduled EDR Contact: 03/22/99

CONSENT: Superfund (CERCLA) Consent Decrees
Source: EPA Regional Offices
Telephone: Varies
Major legal settlements that establish responsibility and standards for cleanup at NPL (Superfund) sites. Released periodically by United States District Courts after settlement by parties to litigation matters.

Date of Government Version: Varies
Database Release Frequency: Varies
Date of Last EDR Contact: Varies
Date of Next Scheduled EDR Contact: N/A

FINDS: Facility Index System
Source: EPA/NTIS
Telephone: 703-908-2493
Facility Index System. FINDS contains both facility information and 'pointers' to other sources that contain more detail. EDR includes the following FINDS databases in this report: PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS (PCB Activity Data System).

Date of Government Version: 09/30/97
Database Release Frequency: Quarterly
Date of Last EDR Contact: 12/23/98
Date of Next Scheduled EDR Contact: 03/29/99

HMIRS: Hazardous Materials Information Reporting System
Source: U.S. Department of Transportation
Telephone: 202-366-4526
Hazardous Materials Incident Report System. HMIRS contains hazardous material spill incidents reported to DOT.

Date of Government Version: 12/31/97
Database Release Frequency: Annually
Date of Last EDR Contact: 03/02/99
Date of Next Scheduled EDR Contact: 04/26/99

MLTS: Material Licensing Tracking System
Source: Nuclear Regulatory Commission
Telephone: 301-415-7169
MLTS is maintained by the Nuclear Regulatory Commission and contains a list of approximately 8,100 sites which possess or use radioactive materials and which are subject to NRC licensing requirements. To maintain currency, EDR contacts the Agency on a quarterly basis.

Date of Government Version: 12/08/98
Database Release Frequency: Quarterly
Date of Last EDR Contact: 03/02/99
Date of Next Scheduled EDR Contact: 05/31/99

NPL LIENS: Federal Superfund Liens
Source: EPA
Telephone: 205-564-4267
Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/91
Database Release Frequency: No Update Planned
Date of Last EDR Contact: 02/22/98
Date of Next Scheduled EDR Contact: 05/24/99

PADS: PCB Activity Database System
Source: EPA
Telephone: 202-260-3936
PCB Activity Database. PADS Identifies generators, transporters, commercial storers and/or brokers and disposers of PCB's who are required to notify the EPA of such activities.

Date of Government Version: 09/22/97
Database Release Frequency: Semi-Annually
Date of Last EDR Contact: 03/05/99
Date of Next Scheduled EDR Contact: 05/17/99

RAATS: RCRA Administrative Action Tracking System
Source: EPA
Telephone: 202-564-4104
RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/95
Database Release Frequency: No Update Planned
Date of Last EDR Contact: 12/15/98
Date of Next Scheduled EDR Contact: 03/15/99

ROD: Records Of Decision
Source: NTIS
Telephone: 703-416-0223
Record of Decision. ROD documents mandate a permanent remedy at an NPL (Superfund) site containing technical and health information to aid in the cleanup.

Date of Government Version: 03/31/95

Historical and Other Database(s)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Former Manufactured Gas (Coal Gas) Sites: The existence and location of Coal Gas sites is provided exclusively to EDR by Real Property Scan, Inc. ©Copyright 1993 Real Property Scan, Inc. For a technical description of the types of hazards which may be found at such sites, contact your EDR customer service representative.

Disclaimer Provided by Real Property Scan, Inc.

The information contained in this report has predominantly been obtained from publicly available sources produced by entities other than Real Property Scan. While reasonable steps have been taken to insure the accuracy of this report, Real Property Scan does not guarantee the accuracy of this report. Any liability on the part of Real Property Scan is strictly limited to a refund of the amount paid. No claim is made for the actual existence of toxins at any site. This report does not constitute a legal opinion.

DELISTED NPL: NPL Deletions
Source: EPA
Telephone: 703-603-8769

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 01/19/99

NFRAP: No Further Remedial Action Planned
Source: EPA
Telephone: 703-413-0223

As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

Date of Government Version: 11/10/98
Date Made Active at EDR: 01/29/99

Date of Last EDR Contact: 03/03/99

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-260-2805
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-260-2805
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SWDIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

Area Radon Information: The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones: Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

Oil/Gas Pipelines/Electrical Transmission Lines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines and electrical transmission lines.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

USGS Water Wells: In November 1971 the United States Geological Survey (USGS) implemented a national water resource information tracking system. This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on more than 900,000 wells, springs, and other sources of groundwater.

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1996 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in March 1997 from the U.S. Fish and Wildlife Service.

Epicenters: World earthquake epicenters, Richter 5 or greater
Source: Department of Commerce, National Oceanic and Atmospheric Administration

Water Dams: National Inventory of Dams
Source: Federal Emergency Management Agency
Telephone: 202-646-2801
National computer database of more than 74,000 dams maintained by the Federal Emergency Management Agency.

County Well Data in Illinois: Cook and DuPage Counties
Source: Illinois State Geological Survey
Telephone: 217-244-2387

Illinois Private Well Database and PICS (Public, Industrial, Commercial Survey)
Source: Illinois State Water Survey
Telephone: 217-333-9043

Illinois State Geological Survey Water Wells
Source: Illinois State Geological Survey
Telephone: 217-333-5102
Point data set that shows locations, well type, and well ID for wells in Illinois. Data comes from driller's logs.

AQUIFLOW^{TM} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

1.0 Executive Summary

This report presents the results of a Phase II Environmental Site Assessment (ESA) investigation at the Chicago Youth Gatreaux Center property. The site is located at 945 East 132nd Street, Chicago, Illinois. The property is currently utilized as a day care center. The property consists of a building, play lot, and parking area.

The objectives of the Phase II ESA investigation consisted of performing a subsurface investigation, to determine whether the site had been adversely impacted by adjacent leaking underground storage tank (UST) sites, and performing asbestos and lead-based paint surveys.

The subsurface investigation consisted of performing a total of five (5) soil borings in locations adjacent to the properties with the former USTs. One soil sample from each boring was submitted to an independent laboratory for analyses. The samples were analyzed for the presence of benzene, toluene, ethyl benzene, and xylene (BTEX), polynuclear aromatic hydrocarbon compounds (PNAs), and total lead. The laboratory analyses indicated that eight PNAs and total lead were detected in the soil boring samples. The Illinois Environmental Protection Agency (IEPA) Tiered Approach to Corrective Action Objectives (TACO) methodology [Illinois Administrative Code Title 35 Section 742 (35 IAC 742)] was used to evaluate the analytes detected in the soil at the site. The evaluation indicated that none of the constituents was present at a concentration exceeding IEPA Tier 1 Soil Remediation Objectives for residential land use. The residential land use scenario is the most conservative SRO developed by IEPA and most protective of human health and environment. Therefore, CCA recommends that no further investigative or remedial action be conducted at the site.

The asbestos survey included collecting a total of forty-two (42) samples from suspect materials. The survey identified the presence of non-friable asbestos-containing materials (ACMs) in floor tiles and mastic present in the office and gym and in ceiling tile present in the hallway areas. The ACMs are on good condition and should not pose an environmental concern to the occupants of the building.

The lead-based paint survey utilized an X-ray fluorescence spectrum analyzer to test all painted surfaces in the building. The survey did not identify any positive component in the building. Therefore, LBP should not be of concern for this building.

Based on the results of the Phase II ESA, CCA does not recommends performing additional investigation or abatement at the site.

2.0 Introduction

Carnow, Conibear & Assoc., Ltd. (CCA) was retained by the City of Chicago Department of General Services to perform Phase II Environmental Site Assessment (ESA) activities at the Chicago Youth Gatreaux Center (Gatreaux), located at 945 East 132nd Street, Chicago, Illinois. CCA initiated this project under contract number T69613201-10. The objectives of the Phase II ESA were following:

- Determine whether a potential release from former underground storage tanks (USTs) located on adjacent properties had impacted the subsurface soils at the site;
- Determine the nature of suspected asbestos-containing materials (ACMs); and
- Determine whether lead-based paint (LBP) is present in any of the building components.

The Phase II ESA field activities were conducted on May 25 and 27, 1999.

The site is located in Section 35 of Township 37 North, Range 14 East in Cook County, Illinois (Exhibit I). The property consists of a paved parking area on the east side of the property, the Youth Center building in the central area of the site, a play lot on the west side of the property, and a lawn area on the north side of the site.

3.0 Background

The Gatreaux property is surrounded by 132nd Place to the south, 132nd Street to the west, a private street (currently utilized as a pedestrian walkway) on the north, and Ellis Avenue on the east. A map of the site is presented as Exhibit II.

The property is zoned as B4-1 (restricted service district). The properties directly north and south of the site are similarly zoned. Other areas in the vicinity are zoned R3 (general residence district). Exhibit III illustrates the zoning of the area.

CCA performed a Phase I ESA in March 1999. The Phase I ESA indicated the following potential environmental concerns:

- The potential presence of subsurface contamination due to former USTs on properties north and west of the site;
- The potential presence of friable and non-friable ACMs; and
- The potential presence of LBP at the site.

4.0 Scope of Work

The objective of the Phase II ESA was to determine whether soil contamination, ACMs, and/or LBP building components are present at the site. CCA's scope of work consisted of the following tasks:

- Advance soil borings on the property;
- Perform quantitative laboratory analyses of selected soil samples collected from the borings;
- Perform a bulk asbestos survey of suspected ACMs;
- Perform quantitative laboratory analyses of the bulk asbestos survey samples;
- Perform a LBP survey utilizing an X-ray fluorescence spectrum analyzer;
- Review and interpret the site investigation analytical results; and
- Prepare a report to document the site investigations and provide recommendations regarding the site regulatory conditions.

5.0 Investigation Methodologies

5.1 Subsurface Soil Investigation

CCA personnel supervised the advancement of five (5) soil borings during the Phase II ESA. The locations of the soil borings were chosen to provide samples from areas of the site which appear to be closest to the off-site locations of two (2) former USTs. The locations chosen were along the northern boundary, at the northwest corner, and along the western boundary of the site. The soil borings were completed to a depth of fifteen (15) feet below ground surface (bgs) on the property. Exhibit II illustrates the location of the soil borings.

C.S. Drilling, Inc. was retained by CCA to conduct the soil boring activities. The field drilling activities were conducted on May 27, 1999. Five (5) soil borings (B-1 through B-5) were advanced on the property using Geoprobe® drilling equipment. Samples were collected by advancing a two and one-half (2.5) inch outer diameter sampling tube with a disposable acetate sleeve inside. Continuous samples were collected from the one (1) foot bgs to a depth of fifteen (15) feet. The sampling tubes were decontaminated prior to each use with an Alconox®/water solution, and were then rinsed with distilled water. The sleeves were disposed after the collection of each sample.

CCA's field representative supervised the drilling operation, collected the soil samples, inspected soil samples for visible signs of contamination, performed field screening of the soil samples, and classified each soil sample in terms of texture and color in accordance with the Unified Soil Classification System (ASTM D-2487-85 and D-2488-84). Each soil sample was field screened utilizing a photoionization detector to qualitatively measure volatile organic compound (VOC) vapors. Soil samples submitted for quantitative analyses were selected based upon field screening measurements and the subsurface lithology encountered. One soil sample was submitted for quantitative analysis from each boring.

Based on the borings conducted on the site, the site soil profile consists of clay and silty clay unit with trace sand and gravel. One boring (B-2) had a discontinuous coarse to medium sand lens present at a depth of approximately eight (8) feet bgs. This thin sand lens [less than one (1) foot thick] was not encountered in any of the other borings. The clay unit was present to the terminus of each boring (15 feet bgs).

Details of the soil profile and sample information are presented on boring logs contained in Appendix A. The locations of the borings are presented on Exhibit II.

5.2 Bulk Asbestos Survey

The bulk asbestos survey was conducted on May 25, 1999 by Marcos Iwankiw, an Illinois Department of Public Health (IDPH) Licensed Asbestos Inspector (ID #100-3175). The survey included the following tasks:

- Perform a visual inspection and physical assessment of the accessible areas to determine the location and quantity of suspected ACMs within the building;

- Collect and analyze bulk samples from suspected ACMs; and

- Submit the samples to the CCA in-house laboratory for analyses.

CCA collected a total of forty-two (42) samples from suspected ACM locations. All samples were collected in accordance with CCA *Bulk Sampling Standard Operating Procedures*. These procedures were developed in-house and are based upon methodologies promulgated in U.S. Environmental Protection Agency (EPA) guidelines. All sampling equipment was double-rinsed with potable water before and after each sampling event.

5.3 Lead-Based Paint Survey

The LBP survey was conducted on May 25, 1999 by Marcos Iwankiw, who is an IDPH Licensed Lead Inspector (ID #100-3175). The survey was performed utilizing an X-ray fluorescence (XRF) spectrum analyzer to determine lead content of suspected LBP building components present in the interior and exterior areas of the building. Each suspected building component was tested at a minimum of three (3) points during the XRF analyses.

6.0 Site Geology and Hydrogeology

6.1 General Area Geology

The site is located within an area of Carmi Member till deposits of the Equality Formation. The Carmi Member was formed by sediments from still water areas of glacial Lake Chicago. The deposit is typified by well-bedded silt with thin beds of clay. Discontinuous, localized lenses of sand and sandy gravel are present in beach areas of the formation (Willman 1971). The till deposits in the vicinity of the site are at least fifty (50) feet thick with no apparent interbedded sand or gravel (Berg, Kempton, and Cartwright 1984).

The bedrock, which directly underlies the till, is of the Racine Formation of the Silurian Niagaran Series. The bedrock is typically composed of gray to white, medium grained, pure to slightly argillaceous, fossiliferous dolomite. Depth to bedrock in the area ranges from approximately 80 to 110 feet. Typically, the upper portion of the dolomite bedrock is fractured, and has increased porosity and permeability.

According to the Illinois Geological Survey Division, Circular 532, Potential for Contamination of Shallow Aquifers in Illinois, the property is located in an area mapped as "E" on Circular 532, *Potential for Contamination of Shallow Aquifers in Illinois*. The "E" classification indicates that relatively impermeable till deposits, at least fifty (50) feet thick, without interbedded sand and gravel deposits (Berg, Kempton, and Cartwright 1984).

6.2 Site Geology

CCA performed a total of five (5) soil borings on the property. The following is a description of the general soil profile encountered during the subsurface investigations:

- A clay unit with trace fine to coarse sand and trace fine gravel. The clay unit is very stiff and typically dry and moderately plastic. The clay unit extended to the bottom of each boring advanced at the site [a depth of fifteen (15) feet bgs].

  A coarse to medium sand lens was encountered within the clay unit at boring B-2. The sand lens was not encountered in any of the other four (4) borings advanced at the site, thus it should be considered discontinuous.

The subsurface lithology encountered at the site is consistent with description of the area geology presented in the Illinois State Geological Survey (ISGS) publications mentioned in Section 6.1. Exhibit IV presents a cross-section illustrating the subsurface materials encountered during completion of the soil borings.

6.3 Groundwater Resources

Potable water in the vicinity of the site is supplied by the City of Chicago Water Department. The department obtains water from intakes located in Lake Michigan. The intakes are located approximately one (1) mile offshore. Additionally, the City of Chicago has enacted a groundwater usage restriction ordinance. The ordinance prohibits the use of wells as a potable water supply source within the corporate boundaries of the city. Therefore, no additional wells can be installed in the vicinity of the site.

A search of ISGS and Illinois State Water Survey databases indicated that one (1) well is located within 2,500 feet of the site. This well is approximately two thousand (2,000) feet southwest of the site and is completed within the upper bedrock unit underlying the area.

Groundwater was not encountered during the advancement of the soil borings [to a maximum explored depth of fifteen (15) feet]. Since groundwater was not encountered within ten feet of the surface, Class I groundwater is assumed to underlie the site. The Class I groundwater ingestion exposure route was used to compare the constituents concentrations encountered on the property with the IEPA remediation objectives.

7.0 Sample Procedures and Analytical Results

7.1 Soil Investigation Sampling

The type of sample containers and preservation procedures used during the sampling is dependent upon the analysis parameters. CCA utilized tared, forty (40) milliliter vials with preservative for the soil aliquots which were to be analyzed for the presence of benzene, toluene, ethylbenzene, and total xylenes (BTEX). The sample was analyzed utilizing U.S. Environmental Protection Agency (EPA) Methods 5035/8021. CCA used one, four (4) ounce borosilicate glass jar for the aliquot analyzed for the presence of polynuclear aromatic hydrocarbon compounds (PNAs) and total lead. The presence of PNAs was analyzed utilizing EPA Method 8310. The presence of total lead was analyzed by a Series 7000 method, respectively. All jars were precleaned to the EPA standards with a Teflon® lined cap used for each container.

Each soil sample was labeled by a unique identification number after it was collected during the sampling activities. Each sample was labeled at the time of sampling with the following information using indelible ink:

- Project/site name;
- Date and time of collection;
- Soil boring number; and
- Name of sample collector

After each soil sample jar was labeled, the jar was placed into an insulated portable cooler with ice. The samples were transported to American Environmental Analytical (AEA) in Chicago, Illinois. A chain-of-custody form was prepared, signed, and dated by the CCA representative and the laboratory representative who received the samples.

7.2 Soil Sample Analytical Results

CCA submitted a total of five (5) representative soil samples to AEA for analysis. The samples were analyzed for BTEX, PNAs, and total lead. The analytical results indicated the presence of several PNA constituents and total lead.

Table I presents a summary of the soil analytical results. A complete copy of the analytical data and chain of custody form are provided in Appendix B.

7.3 Discussion of Soil Sample Analytical Results

CCA evaluated the concentrations of the constituents encountered at the property in relation to the SROs promulgated in 35 IAC 742 (TACO). The Tier 1 evaluation compares the concentration of contaminants detected at the property to residential SROs developed by the IEPA for various exposure routes. Tier 1 SROs are based on prudently conservative assumptions and take into account only limited site-specific information such as contaminant concentrations, class of groundwater, receptor classification, and some appropriate soil parameters. Tier 1 allows for differentiating between residential and industrial/commercial properties. Based on the use of the subject property as a youth center, the Tier 1 residential exposure scenario was used to compare the constituent concentrations in the subsurface soils with the IEPA SROs. Residential SROs are the most conservative SROs developed by IEPA and are the most protective of human health and environment.

The results of the Phase II ESA indicated that none of the detected constituents is present at a concentration exceeding an IEPA Tier 1 SRO. Thus, the subsurface soil has not been impacted by leaking UST (LUST) incidents at the adjacent properties. Based on the analytical results, it is CCA's opinion that there are no environmental concerns present on site and associated with the LUST incidents at the adjacent off-site locations.

7.4 Bulk Asbestos Survey Analyses

The samples collected during the bulk asbestos survey were placed in pre-cleaned containers after collection. Each container was assigned an identification number. CCA also prepared a chain-of-custody form prior to submittal of the samples to CCA's in-house laboratory.

CCA's laboratory is accredited for bulk asbestos fiber analyses by the National Voluntary Laboratory Accreditation Program (NVLAP) and the American Industrial Hygiene Association (AIHA). CCA utilized dispersion staining and polarized light microscopy (PLM) techniques to analyze the samples, which is consistent with National Institute of Occupational Safety and Health (NIOSH) Method 7403. PLM is the EPA's recognized method for determining bulk asbestos content.

7.5 Discussion of Bulk Asbestos Survey Results

The results of the bulk asbestos survey indicated that non-friable ACMs were present in the office and gym areas of the building. Table II presents a summary of the PLM results. Exhibit V illustrates the identified ACM areas. ACMs identified by PLM are also identified by type of asbestos fiber, percentage of composition, and estimated quantity of ACMs.

The analytical results indicated that approximately 1,500 square feet (ft^2) of ACMs were present in the floor tile, floor tile mastic, and transite ceiling tiles of the office. The ACM was identified as containing chrysotile, with composition ranging from one (1) to seventy (70) percent.

The analytical results also identified the floor tile and floor tile mastic in the gym as a chrysotile-containing ACM. A total of approximately 4,000 ft^2 of ACMs were identified in the gym with compositions ranging from five (5) to thirty (30) percent.

Additionally, samples collected of caulking from the interior windows exhibited the presence of chrysotile. Estimated composition of the caulk was five (5) to ten (10) percent.

All ACMs are in good condition and should not pose an environmental concern to the building occupants. CCA does not recommend performing an additional investigation for ACMs unless suspect materials, which were previously inaccessible, are discovered during future renovation work at the site.

7.6 Lead-Based Paint Survey Analyses

Building components with suspected LBP content were tested by the XRF spectrum analyzer at three (3) sample locations during the survey. No LBP materials were identified during the field survey. Table III identifies the building components tested and summarizes the results of the XRF analyses. The table also indicates the color of the suspected LBP and the substrate underlying the suspected LBP.

8.0 Conclusions and Recommendations

CCA performed a Phase II ESA for the Gatreaux Center property, located at 945 East 132nd Street, Chicago, Illinois. The scope of work for the Phase II ESA activities consisted of performing a subsurface soil investigation and performing asbestos and lead-based paint surveys.

The Phase II subsurface investigation included advancing five (5) soil borings on the property and collecting soil samples from the borings to determine whether the site has been adversely impacted by two (2) leaking USTs at adjacent properties.

The IEPA TACO methodology (35 IAC 742) was used to evaluate the analytes detected in the soil at the site. None of the analytes was present at a concentration exceeding applicable IEPA Tier 1 objectives. This indicates that the site has not been adversely impacted by the LUST incidents at the adjacent properties. Therefore, the site should not subject to regulatory/remediation requirements associated with releases from former LUST sites.

The bulk asbestos survey completed at the site identified the presence of non-friable ACMs in the floor tiles and mastic in the office and gym areas. The estimated total area of these ACMs is approximately 5,500 ft^2. CCA also identified interior window caulk in the office as ACM. CCA does not recommend performing any additional investigations nor performing any abatement work at the site unless future renovation work is planned for the areas in which ACMs are present or previously inaccessible suspect material is discovered at the site.

The lead-based paint survey at the site did not identify any building components with LBP.

Based on the results of the Phase II ESA, no environmental concerns were identified during the site investigation. CCA does not recommend performing any additional investigation or abatement work at the site.

CCA makes no warranty, express or implied, that the findings and interpretations in this report are a complete representation of the environmental hazards and liabilities, associated with the site. CCA's findings are based upon the scope of work requested by the client and should not be interpreted as a complete presentation of the site conditions. There may be unrecorded information or documentation from previous owners or tenants that is unattainable and may be proprietary, legally protected, or unavailable through government regulatory services.

LABORATORY DATA REPORT

CLIENT

Carnow, Conibear & Associates
333 West Wacker Dr., Suite1400
Chicago, Illinois, 60606-1218

PROJECT NAME : **Gatreaux Youth Center**
NUMBER# : 12951-E016
TASK ORDER :
ATTN : **Mike Duet**
RECEIVED : 05/28/99
REPORTED : 06/08/99
FILE ID# : **99006126 THRU 99006130**

PROJECT SUMMARY:

Analyses were performed in accordance with the methods found in the USEPA publication: Test Methods for Evaluating Solid Waste, Physical/Chemical methods, SW- 846, 3rd Edition, December 1996. Specific method references are listed on the analytical report.

Results have been expressed on a "wet" weight (as recived) basis except where otherwise specified .

All analyses were performed within established holding times, and all Quality Control criteria as outlined in the methods have been met.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS list

CERCLIS: The Comprehensive Environmental Response, Compensation and Liability Information System contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the CERCLIS list, as provided by EDR, and dated 10/25/2013 has revealed that there is 1 CERCLIS site within approximately 0.5 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
PULLMAN FACTORY	130TH ST & INDIANA	W 1/4 - 1/2 (0.498 mi.)	37	34

Federal CERCLIS NFRAP site List

CERC-NFRAP: Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

A review of the CERC-NFRAP list, as provided by EDR, and dated 10/25/2013 has revealed that there is 1 CERC-NFRAP site within approximately 0.5 miles of the target property.

CALUMET NU-EARTH DIST CENTER	NORTH 130TH ST & DOTY A	NE 0 - 1/8 (0.086 mi.)	F28	29

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 03/11/2014 has revealed that there are 2 CORRACTS sites within approximately 1 mile of the target property.

Federal RCRA generators list

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/11/2014 has revealed that there are 4

RCRA-SQG sites within approximately 0.25 miles of the target property.

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 03/11/2014 has revealed that there are 2 RCRA-CESQG sites within approximately 0.25 miles of the target property.

State and tribal landfill and/or solid waste disposal site lists

IL NIPC: NIPC is an inventory of active and inactive solid waste disposal sites, based on state, local government and historical archive data. Included are numerous sites that previously had never been identified largely because, prior to 1971, there was no obligation to register such sites. The data come from the Northeastern Illinois Planning Commission's Solid Waste Landfill Inventory.

A review of the IL NIPC list, as provided by EDR, and dated 08/01/1988 has revealed that there are 5 IL NIPC sites within approximately 0.5 miles of the target property.

PALUMBO EXCAVATING		E 1/4 - 1/2 (0.414 mi.)	36	33

State and tribal registered storage tank lists

IL UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the Illinois State Fire Marshal's STC Facility List.

A review of the IL UST list, as provided by EDR, and dated 01/27/2014 has revealed that there are 4

IL UST sites within approximately 0.25 miles of the target property.

ADDITIONAL ENVIRONMENTAL RECORDS

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/11/2014 has revealed that there is 1 RCRA NonGen / NLR site within approximately 0.25 miles of the target property.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR US Hist Cleaners: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

A review of the EDR US Hist Cleaners list, as provided by EDR, has revealed that there are 5 EDR US Hist Cleaners sites within approximately 0.25 miles of the target property.

Environmental Interest/Information System
AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

ACES (Illinois - Agency Compliance And Enforcement System) is the Illinois EPA Project to facilitate the permitting operations

Environmental Interest/Information System

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

ACES (Illinois - Agency Compliance And Enforcement System) is the Illinois EPA Project to facilitate the permitting operations

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

ICIS (Integrated Compliance Information System) is the Integrated

CHICAGO HOUSING AUTHORITY (Continued) **1000166304**

Compliance Information System and provides a database that, when complete, will contain integrated Enforcement and Compliance information across most of EPA's programs. The vision for ICIS is to replace EPA's independent databases that contain Enforcement data with a single repository for that information. Currently, ICIS contains all Federal Administrative and Judicial enforcement actions. This information is maintained in ICIS by EPA in the Regional offices and it Headquarters. A future release of ICIS will replace the Permit Compliance System (PCS) which supports the NPDES and will integrate that information with Federal actions already in the system. ICIS also has the capability to track other activities occurring in the Region that support Compliance and Enforcement programs. These include; Incident Tracking, Compliance Assistance, and Compliance Monitoring.

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Legal status:	Private
Owner/Operator Type:	Owner
Owner/Op start date:	Not reported
Owner/Op end date:	Not reported

Handler Activities Summary:

U.S. importer of hazardous waste:	No
Mixed waste (haz. and radioactive):	No
Recycler of hazardous waste:	No
Transporter of hazardous waste:	No
Treater, storer or disposer of HW:	No
Underground injection activity:	No
On-site burner exemption:	No
Furnace exemption:	No
Used oil fuel burner:	No
Used oil processor:	No
User oil refiner:	No
Used oil fuel marketer to burner:	No
Used oil Specification marketer:	No
Used oil transfer facility:	No
Used oil transporter:	No

Historical Generators:

Date form received by agency:	03/26/1981
Facility name:	BARKER CHEMICAL CO
Classification:	Not a generator, verified

BARKER CHEMICAL CO (Continued) **1000269195**

Corrective Action Summary:

Event date:	09/27/1991
Event:	CA Prioritization, Facility or area was assigned a high corrective action priority.
Event date:	11/13/1991
Event:	RFA Completed
Event date:	02/21/1992
Event:	Stabilization Measures Evaluation,This facility is amenable to stabilization activity based on the status of corrective action work at the facility, technical factors, the degree of risk, timing considerations and administrative considerations.
Violation Status:	No violations found

Registry ID: 110009366550

Environmental Interest/Information System

ACES (Illinois - Agency Compliance And Enforcement System) is the Illinois EPA Project to facilitate the permitting operations

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

SAFETY KLEEN ENVIROSYSTEMS INC (Continued) **1000222289**

Waste code: D003
Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Waste code: F001
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLOROETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE, AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F002
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2-TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE LISTED IN F001, F004, OR F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F004
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: CRESOLS AND CRESYLIC ACID, AND NITROBENZENE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, AND F005; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F005
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS

SAFETY KLEEN ENVIROSYSTEMS INC (Continued) **1000222289**

CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F006
Waste name: WASTEWATER TREATMENT SLUDGES FROM ELECTROPLATING OPERATIONS EXCEPT FROM THE FOLLOWING PROCESSES: (1) SULFURIC ACID ANODIZING OF ALUMINUM; (2) TIN PLATING ON CARBON STEEL; (3) ZINC PLATING (SEGREGATED BASIS) ON CARBON STEEL; (4) ALUMINUM OR ZINC-ALUMINUM PLATING ON CARBON STEEL; (5) CLEANING/STRIPPING ASSOCIATED WITH TIN, ZINC AND ALUMINUM PLATING ON CARBON STEEL; AND (6) CHEMICAL ETCHING AND MILLING OF ALUMINUM.

Waste code: F007
Waste name: SPENT CYANIDE PLATING BATH SOLUTIONS FROM ELECTROPLATING OPERATIONS

Waste code: F008
Waste name: PLATING BATH RESIDUES FROM THE BOTTOM OF PLATING BATHS FROM ELECTROPLATING OPERATIONS WHERE CYANIDES ARE USED IN THE PROCESS.

Waste code: F009
Waste name: SPENT STRIPPING AND CLEANING BATH SOLUTIONS FROM ELECTROPLATING OPERATIONS WHERE CYANIDES ARE USED IN THE PROCESS.

Waste code: F010
Waste name: QUENCHING BATH RESIDUES FROM OIL BATHS FROM METAL HEAT TREATING OPERATIONS WHERE CYANIDES ARE USED IN THE PROCESS.

Waste code: F011
Waste name: SPENT CYANIDE SOLUTIONS FROM SALT BATH POT CLEANING FROM METAL HEAT TREATING OPERATIONS.

Waste code: F012
Waste name: QUENCHING WASTE WATER TREATMENT SLUDGES FROM METAL HEAT TREATING OPERATIONS WHERE CYANIDES ARE USED IN THE PROCESS.

Waste code: F019
Waste name: WASTEWATER TREATMENT SLUDGES FROM THE CHEMICAL CONVERSION COATING OF ALUMINUM EXCEPT FROM ZIRCONIUM PHOSPHATING IN ALUMINUM CAN WASHING WHEN SUCH PHOSPHATING IS AN EXCLUSIVE CONVERSION COATING PROCESS.

Waste code: F020
Waste name: WASTES (EXCEPT WASTEWATER AND SPENT CARBON FROM HYDROGEN CHLORIDE PURIFICATION) FROM THE PRODUCTION OR MANUFACTURING USE (AS A REACTANT, CHEMICAL INTERMEDIATE, OR COMPONENT IN A FORMULATING PROCESS) OF TRI- OR TETRACHLOROPHENOL, OR OF INTERMEDIATES USED TO PRODUCE THEIR PESTICIDE DERIVATIVES. (THIS LISTING DOES NOT INCLUDE WASTES FROM THE PRODUCTION OF HEXACHLOROPHENE FROM HIGHLY PURIFIED 2,4,5-TRICHLOROPHENOL).

Waste code: F021
Waste name: WASTES (EXCEPT WASTEWATER AND SPENT CARBON FROM HYDROGEN CHLORIDE PURIFICATION) FROM THE PRODUCTION OR MANUFACTURING USE (AS A REACTANT, CHEMICAL INTERMEDIATE, OR COMPONENT IN A FORMULATING PROCESS) OF PENTACHLOROPHENOL, OR OF INTERMEDIATES USED TO PRODUCE ITS DERIVATIVES.

SAFETY KLEEN ENVIROSYSTEMS INC (Continued) **1000222289**

Waste code:	F022
Waste name:	WASTES (EXCEPT WASTEWATER AND SPENT CARBON FROM HYDROGEN CHLORIDE PURIFICATION) FROM THE MANUFACTURING USE (AS A REACTANT, CHEMICAL INTERMEDIATE, OR COMPONENT IN A FORMULATING PROCESS) OF TETRA-, PENTA-, OR HEXACHLOROBENZENES UNDER ALKALINE CONDITIONS.
Waste code:	F023
Waste name:	WASTES (EXCEPT WASTEWATER AND SPENT CARBON FROM HYDROGEN CHLORIDE PURIFICATION) FROM THE PRODUCTION OF MATERIALS ON EQUIPMENT PREVIOUSLY USED FOR THE PRODUCTION OR MANUFACTURING USE (AS A REACTANT, CHEMICAL INTERMEDIATE, OR COMPONENT IN A FORMULATING PROCESS) OF TRI- AND TETRACHLOROPHENOLS. (THIS LISTING DOES NOT INCLUDE WASTES FROM EQUIPMENT USED ONLY FOR THE PRODUCTION OR USE OF HEXACHLOROPHENE FROM HIGHLY PURIFIED 2,4,5-TRICHLOROPHENOL).
Waste code:	F024
Waste name:	PROCESS WASTES, INCLUDING BUT NOT LIMITED TO, DISTILLATION RESIDUES, HEAVY ENDS, TARS, AND REACTOR CLEAN-OUT WASTES, FROM THE PRODUCTION OF CERTAIN CHLORINATED ALIPHATIC HYDROCARBONS BY FREE RADICAL CATALYZED PROCESSES. THESE CHLORINATED ALIPHATIC HYDROCARBONS ARE THOSE HAVING CARBON CHAIN LENGTHS RANGING FROM ONE TO AND INCLUDING FIVE, WITH VARYING AMOUNTS AND POSITIONS OF CHLORINE SUBSTITUTION. (THIS LISTING DOES NOT INCLUDE WASTEWATERS, WASTEWATER TREATMENT SLUDGES, SPENT CATALYSTS, AND WASTES LISTED IN SECTION 261.31 OR SECTION 261.32).
Waste code:	F025
Waste name:	CONDENSED LIGHT ENDS, SPENT FILTERS AND FILTER AIDS, AND SPENT DESICCANT WASTES FROM THE PRODUCTION OF CERTAIN CHLORINATED ALIPHATIC HYDROCARBONS, BY FREE RADICAL CATALYZED PROCESSES. THESE CHLORINATED ALIPHATIC HYDROCARBONS ARE THOSE HAVING CARBON CHAIN LENGTHS RANGING FROM ONE TO AND INCLUDING FIVE, WITH VARYING AMOUNTS AND POSITIONS OF CHLORINE SUBSTITUTION.
Waste code:	F026
Waste name:	WASTES (EXCEPT WASTEWATER AND SPENT CARBON FROM HYDROGEN CHLORIDE PURIFICATION) FROM THE PRODUCTION OF MATERIALS ON EQUIPMENT PREVIOUSLY USED FOR THE MANUFACTURING USE (AS A REACTANT, CHEMICAL INTERMEDIATE, OR COMPONENT IN A FORMULATING PROCESS) OF TETRA-, PENTA-, OR HEXACHLOROBENZENE UNDER ALKALINE CONDITIONS.
Waste code:	F027
Waste name:	DISCARDED UNUSED FORMULATIONS CONTAINING TRI-, TETRA-, OR PENTACHLOROPHENOL OR DISCARDED UNUSED FORMULATIONS CONTAINING COMPOUNDS DERIVED FROM THESE CHLOROPHENOLS. (THIS LISTING DOES NOT INCLUDE FORMULATIONS CONTAINING HEXACHLOROPHENE SYTHESIZED FROM PREPURIFIED 2,4,5-TRICHLOROPHENOL AS THE SOLE COMPONENT).
Waste code:	F028
Waste name:	RESIDUES RESULTING FROM THE INCINERATION OR THERMAL TREATMENT OF SOIL CONTAMINATED WITH EPA HAZARDOUS WASTE NOS. F020, F021, F022, F023, F026, AND F027.
Waste code:	F032
Waste name:	WASTEWATERS, PROCESS RESIDUALS, PRESERVATIVE DRIPPAGE, AND SPENT FORMULATIONS FROM WOOD PRESERVING PROCESSES GENERATED AT PLANTS THAT CURRENTLY USE OR HAVE PREVIOUSLY USED CHLOROPHENOLIC FORMULATIONS (EXCEPT POTENTIALLY CROSS-CONTAMINATED WASTES THAT HAVE HAD THE F032

SAFETY KLEEN ENVIROSYSTEMS INC (Continued) **1000222289**

WASTE CODE DELETED IN ACCORDANCE WITH SECTION 261.35 OF THIS CHAPTER AND WHERE THE GENERATOR DOES NOT RESUME OR INITIATE USE OF CHLOROPHENOLIC FORMULATIONS). THIS LISTING DOES NOT INCLUDE K001 BOTTOM SEDIMENT SLUDGE FROM THE TREATMENT OF WASTEWATER FROM WOOD PRESERVING PROCESSES THAT USE CREOSOTE AND/OR PENTACHLOROPHENOL. (NOTE: THE LISTING OF WASTEWATERS THAT HAVE NOT COME INTO CONTACT WITH PROCESS CONTAMINANTS IS STAYED ADMINISTRATIVELY. THE LISTING FOR PLANTS THAT HAVE PREVIOUSLY USED CHLOROPHENOLIC FORMULATIONS IS ADMINISTRATIVELY STAYED WHENEVER THESE WASTES ARE COVERED BY THE F034 OR F035 LISTINGS. THESE STAYS WILL REMAIN IN EFFECT UNTIL FURTHER ADMINISTRATIVE ACTION IS TAKEN.)

Waste code:	F034
Waste name:	WASTEWATERS, PROCESS RESIDUALS, PRESERVATIVE DRIPPAGE, AND SPENT FORMULATIONS FROM WOOD PRESERVING PROCESS GENERATED AT PLANTS THAT USE CREOSOTE FORMULATIONS. THIS LISTING DOES NOT INCLUDE K001 BOTTOM SEDIMENT SLUDGE FROM THE TREATMENT OF WASTEWATER FROM WOOD PRESERVING PROCESSES THAT USE CREOSOTE AND/OR PENTACHLOROPHENOL. (NOTE: THE LISTING OF WASTEWATERS THAT HAVE NOT COME INTO CONTACT WITH PROCESS CONTAMINANTS IS STAYED ADMINISTRATIVELY. THE STAY WILL REMAIN IN EFFECT UNTIL FURTHER ADMINISTRATIVE ACTION IS TAKEN.)
Waste code:	F035
Waste name:	WASTEWATERS, PROCESS RESIDUALS, PRESERVATIVE DRIPPAGE, AND SPENT FORMULATIONS FROM WOOD PRESERVING PROCESS GENERATED AT PLANTS THAT USE INORGANIC PRESERVATIVES CONTAINING ARSENIC OR CHROMIUM. THIS LISTING DOES NOT INCLUDE K001 BOTTOM SEDIMENT SLUDGE FROM THE TREATMENT OF WASTEWATER FROM WOOD PRESERVING PROCESSES THAT USE CREOSOTE AND/OR PENTACHLOROPHENOL (NOTE: THE LISTING OF WASTEWATERS THAT HAVE NOT COME INTO CONTACT WITH PROCESS CONTAMINANTS IS STAYED ADMINISTRATIVELY. THE STAY WILL REMAIN IN EFFECT UNTIL FURTHER ADMINISTRATIVE ACTION IS TAKEN.).
Waste code:	F037
Waste name:	PETROLEUM REFINERY PRIMARY OIL/WATER/SOLIDS SEPARATION SLUDGE-ANY SLUDGE GENERATED FROM THE GRAVITATIONAL SEPARATION OF OIL/WATER/SOLIDS DURING THE STORAGE OR TREATMENT OF PROCESS WASTEWATERS AND OILY COOLING WASTEWATERS FROM PETROLEUM REFINERIES. SUCH SLUDGES INCLUDE, BUT ARE NOT LIMITED TO, THOSE GENERATED IN: OIL/WATER/SOLIDS SEPARATORS; TANKS AND IMPOUNDMENTS; DITCHES AND OTHER CONVEYANCES; SUMPS; AND STORMWATER UNITS RECEIVING DRY WEATHER FLOW. SLUDGE GENERATED IN STORMWATER UNITS THAT DO NOT RECEIVE DRY WEATHER FLOW, SLUDGES GENERATED FROM NON-CONTACT ONCE-THROUGH COOLING WATERS SEGREGATED FOR TREATMENT FROM OTHER PROCESS OR OILY COOLING WATERS, SLUDGES GENERATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS AS DEFINED IN SECTION 261.31(B)(2) (INCLUDING SLUDGES GENERATED IN ONE OR MORE ADDITIONAL UNITS AFTER WASTEWATERS HAVE BEEN TREATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS) AND K051 WASTES ARE NOT INCLUDED IN THIS LISTING.
Waste code:	F038
Waste name:	PETROLEUM REFINERY SECONDARY (EMULSIFIED) OIL/WATER/SOLIDS SEPARATION SLUDGE-ANY SLUDGE AND/OR FLOAT GENERATED FROM THE PHYSICAL AND/OR CHEMICAL SEPARATION OF OIL/WATER/SOLIDS IN PROCESS WASTEWATERS AND OILY COOLING WASTEWATERS FROM PETROLEUM REFINERIES. SUCH WASTES INCLUDE, BUT ARE NOT LIMITED TO, ALL SLUDGES AND FLOATS GENERATED IN: INDUCED AIR FLOTATION (IAF) UNITS, TANKS AND IMPOUNDMENTS, AND ALL

SAFETY KLEEN ENVIROSYSTEMS INC (Continued) **1000222289**

SLUDGES GENERATED IN DAF UNITS. SLUDGES GENERATED IN STORMWATER UNITS THAT DO NOT RECEIVE DRY WEATHER FLOW, SLUDGES GENERATED FROM NON-CONTACT ONCE-THROUGH COOLING WATERS SEGREGATED FOR TREATMENT FROM OTHER PROCESS OR OILY COOLING WATERS, SLUDGES AND FLOATS GENERATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS AS DEFINED IN SECTION 261.31(B)(2) (INCLUDING SLUDGES AND FLOATS GENERATED IN ONE OR MORE ADDITIONAL UNITS AFTER WASTEWATERS HAVE BEEN TREATED IN AGGRESSIVE BIOLOGICAL TREATMENT UNITS) AND F037, K048, AND K051 WASTES ARE NOT INCLUDED IN THIS LISTING.

Waste code: F039
Waste name: LEACHATE (LIQUIDS THAT HAVE PERCOLATED THROUGH LAND DISPOSED WASTES) RESULTING FROM THE DISPOSAL OF MORE THAN ONE RESTRICTED WASTE CLASSIFIED AS HAZARDOUS UNDER SUBPART D OF THIS PART. (LEACHATE RESULTING FROM THE DISPOSAL OF ONE OR MORE OF THE FOLLOWING EPA HAZARDOUS WASTES AND NO OTHER HAZARDOUS WASTES RETAINS ITS EPA HAZARDOUS WASTES NUMBER(S): F020, F021, F022, F026, F027, AND/OR F028).

Waste code: K001

Biennial Reports:

Last Biennial Reporting Year: 2013

Annual Waste Handled:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Amount (Lbs):	40444056.9
Waste code:	D002
Waste name:	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A

SAFETY KLEEN ENVIROSYSTEMS INC (Continued) **1000222289**

CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
